The Research Reports of the Pakistan Institute of Development Economics are circulated to inform interested persons with regard to research progress at the Institute. These reports may be freely circulated but they are not to be quoted without the permission of the author. Work on this manuscript is still in progress; comments are invited to improve the final version.

1.1 TEXT

1.1.1 Introduction and Scope of Study

This volume contains statistical tables for 68 administrative districts of Pakistan as they existed at the time of the 1961 census. (Some changes in the boundaries of a few districts have occurred after this Census). The data presented in the tables appear as statistical series of area figures for the period 1881-1961. We hope that this statistical compilation for ^{the} districts of Pakistan will provide a historic continuity in the district area changes.

This basic record of historical series of district area figures of Pakistan, is in itself a research project of some magnitude. But its long-run uses in the Pakistan Institute of Development Economics, Karachi and outside for various research projects, both of demographic and non-demographic nature, are its real worth. It makes possible a separation of total growth in district population as between changes occurring due to changes in area and change occurring because of genuine demographic increase (natural increase or migration). [a companion study undertaking this task is under preparation].

The data presented in this volume should also be helpful to government and private agencies dedicated to planning or development of economic and social set up in this country. To researchers also this statistical information may be helpful in providing a comprehensive statistical series for the districts dated back to 1881. Government and the district administrators can use this statistical table as a summarised picture for the changes in the boundaries or transfer of territories in the districts between 1881-1961.

To social and economic planners, this statistical paper may also be more useful. It would provide them a comprehensive and detailed information as a recorded document of gain and loss and creation of new districts. (When completed the intercensal rate of changes in population broken

down by source of change between 1881-1961 will be helpful to them in the assessment of economic or social needs and in planning the development programmes for the districts.)

A district is defined as an administrative district. In our text the term "district" has been used in place of administrative district for the sake of simplicity. At the time of the 1961 census, census districts were the same as the administrative districts.

In 1961 East Pakistan contained 17 districts with a mean size of 3,243 square miles and a mean population of 2,990,602. Comparable figures for West Pakistan were 51 districts (and agencies), 6,086 square miles and 840,792 population. Districts have been consistently used as a tabulation unit in the decennial censuses over the past 80 years.

A district is a fourth layer administrative unit after the nation, province and division. It consists of sub-divisions, thanas and union councils in East Pakistan and sub-divisions, thesils and union councils in West Pakistan. A district more or less contains homogenous population; it is therefore the basic unit for presenting various statistical data. In the case of administrative units above the district level, namely, the divisions, the group cohesion of the constituent population becomes diluted. If there are several administrative tiers below the district, the constituent areas become small in size and larger in number. The districts are popular research areas because they are seats of many government and private institutions. The districts are also centres of social and economic development. They reflect the more pressing economic, social and political problems which are responsible for progress. The census reports generally show their results by various administrative units - divisions, districts, subdivisions, thesils (sometimes villages) and police stations. But usually the results are shown only upto

district level. Thus, the district is the key unit for analysis of many demographic changes over time.

1.1.2 Explanation of Causes of Change.

In this study we have classified changes in the boundaries of the districts in Pakistan into seven causes explained below:

1. Unexplained Residual: It is the balance of areas between two censuses which remains unexplained and unclassifiable. It is either shown as plus or minus.

2. Lost to adjacent district (cause 2). When a district loses territory to an adjacent district for the latter's outright creation or mere additions, we say that the former district lost by cause 2.

3. Acquired from adjacent district (cause 3). Refers to the area gained by a district from an adjacent district.

4. Creation of a new district (cause 4): This is done (as mentioned in item 2) by acquiring areas from an adjacent district, by conquest or by annexation of foreign territories.

5. Abolition of a district (cause 5): Refers to the area lost by a district when its existence is terminated and its territory handed over to another district.

6. River action (cause 6): When a river changes its course thereby reducing or increasing a district's boundaries we say that the district has lost or gained so many square miles due to "river action".

7. Change of definition of land area (cause 7): This is most important in the case of East Pakistan in 1961 and centres around the treatment of tidal areas (foreshore.) and certain river areas. The 1951 area figure (54,141) excluded such areas, **while** the 1961 area figure includes them.

While all causes are common to both East and West Pakistan, cause 7 (change due to definition of land area) is specially found in East Pakistan and that too only in 1961. Causes 2

(loss to an adjacent district), 3(gained from adjacent district), and 4(creation of a new district by cause 2 above or by conquest or annexation) have been most prominent in affecting changes in district boundaries.

There are some obvious complimenarities among these several causes. For example:

1. When a district was split into two or more districts, or area transferred from one districts to anothers (causes 2); or when a particular district was abolished and its territories were annexed to one or more adjacent districts (cause 5).

2. When a new district was carved out of the territories of one or more adjacent districts. Or when a new district was conquered or annexed. (cause 4).

3. When one district gained some territories from one or several adjacent districts. (cause 3). This was different from no.2 in as much as the district which gained territory in no.2 was not in existence prior to that change, whereas the district gaining the territories in no.3 was already in existence.

1.1.3 Methods Followed

For the purposes of this analysis, the area and population figures of the districts of Pakistan as published in the various census reports of the Indo-Pak Sub-Continent were accepted as reliable and final. In cases of jurisdictional change there were no published documents, but only through a persual of the figures of the districts in two consecutive census reports some changes of areas were detected and documented in this paper. The year to year change in the jurisdiction of the districts have been explained on the basis of information provided in the census reports, the old district gazetteers, the imperial gazetterrs of India and the gazette notifications of the central and provincial governments.

The work involved in discovering and documenting the changes which occurred in the district boundaries of Pakistan

since 1881 was actually one of compilation of the district area figures along with comprehensive notes for each change in the district boundaries. The analysis of the district figures of Pakistan has been done on the following lines:-

1. The districts of Pakistan as they existed in 1961 are taken and traced back to their origin. All the changes occurring in their boundaries are noted.

2. The net intercensal change in area of each district is presented for the decennial census year taking into account all changes that took place during the previous intercensal period.

3. The area in square miles of each district as reported at the various past population census year are presented. These figures are not adjusted to conform to the present boundaries.

4. The effective date of a change has been taken to be the date of publication of the notification unless it was specifically mentioned that it was different from the date of publication.

The presentation of this statistical paper in its present form has evolved through different stages involving extraction of information, verification and scrutiny of the data. A brief illustration to give a more vivid picture of the different stages is as follows:-

1. The data from the source documents (census reports) were collected on Form DEM 3, District Summary of Census totals. (appendix C). The data collected on this form gave no details other than the decennial area and population figures about each district.

2. The data collected as a sort of summary on Form DEM 3 (appendix C) were transferred to Form DEM 2 (appendix D). This was also used to extract and enter much detailed information with regard to intercensal changes in the boundaries, transfer of territories with description of areas gained or lost and equally detailed information about population of the district

This form was a useful worksheet for extraction and entry of information and could accommodate all minute details about the district.

3. The last stage of the analysis is given on Form DEM 24 (appendix E). This form was designed to provide the layout of the actual page in the published form. All the information detailed on Form DEM 2 (appendix D) were transferred systematically on this form. The additional information made available on these forms was about population growth rates i.e., intercensal and annual percentage rates of increase. The summary tables shown in this paper (Tables I-VI) are based on the data contained in the Forms DEM.2. (Appendix D). To avoid under cluttering of the text references to the specific sources are not shown for Tables I to VI. But, the precise references for each district and each year are shown in appendix F. Using these sources and the specimen worksheets (Forms DEM 3, DEM 2 and DEM 24) as explained above the figures in the tables can easily be verified.

1.1.4 Summary and Overview

Overall, one is struck with the amount of stability and continuity the districts making up present-day Pakistan have shown over time with only a handful of exceptions the districts in existence in 1881 are still in existence with only minor changes in their configuration. Similarly, new districts, once created, show the same stability. The total area affected by decade-to-decade changes has been small.

In general, except for population and area interchange with districts now in other countries, causes (2) plus (5) should equal causes (3) plus (4) \surd causes (6) and (7) are special cases \surd . In the period 1951-1961 in West Pakistan the total area of the Province changed by +167 square miles reflecting the acquisition of +260 sq. miles in Gwadar enclave (from Muscat and Oman) and boundary redefinitions of -93 sq. miles.

East Pakistan showed a net change of + 984 sq. miles reflecting - 907 in apparent boundary redefinitions and + 1,891 stemming largely from a definitional change in the treatment of swamp, and intermittent water-course areas (cause 7).

The net gains and losses in the area of the districts of old British India stemming from partition can be seen as the balance of causes (2) plus (5) minus (3) plus (4) for the 1941-1951 period. By this measure the districts of East Pakistan gained 70 square miles and the districts of West Pakistan gained 28,766 square miles during partition.

For the earlier years (1881 to 1941) net balances in the causes (2) plus (5) minus causes (3) plus (4) balance presumably reflect interchanges with districts now located in India, Burma, or the disputed territories (e.g. Jammu and Kashmir).

The unexplained residuals (cause I) are, of course, puzzling. To some extent they are probably self-cancelling with some of the cause (2) or (3) changes. That is, one district, gains (or loses) area according to the printed records while the losing (or gaining) district's records fail to show the cause of the change in its area. Some of the unexplained residual might in fact be explained by some part of the (2) plus (5) minus (3) plus (4) balance. Other cause (1) changes are due to: unspecified changes in frontier boundaries [many of the districts showing cause (1) changes are frontier districts]; shifting definitions of the land areas involved as new surveys are taken and new base maps prepared; error and inconsistency in the data, district to district and year to year.

x Districts changed or merged in 1961 Census.

* Former Administrative districts now abolished.

x were in existence in the present area of Pakistan but are now abolished.

EXPLANATORY NOTES

A.1 LOGIC OF FORM DEM.24

The basic worksheet used was Form DEM.24 (appendix E). The left hand side has been designed to record changes in the boundaries of the district and the right hand side to record changes in the population both due to changes in boundaries and the natural increase in population of the district.

A.2 Code

A code is a number given to a particular district by the Demographic Section of the PIDE for convenience.

A.3 Names

Names used for a district in 1961 census have been adopted. The old name of a district has been maintained in recording changes concerning them. Old names have been given in the footnotes.

A.4 Bench - marks

To highlight the intercensal changes in the boundaries the census years are used as bench marks in the Statistical Series of the paper. A single year refers to a definite census year or any particular year between two censuses when change was reported. A period (two census years) indicates that no specific mention to any year about the change was noted but it was reported during two censuses.

A.5 Type of Change

Mention about the type of change involved in the gain or loss of territories has been made in the statistical series.

A.6 (+), (-)

(+) means amount of territories gained by the district and (-) indicates the territories lost by the district.

A.7 Unexplained residual

Whenever there remains a positive or negative balance of areas after adjusting for all known changes, it is left under lined and it is indicated against it by "unexplained residual". This remains as an unexplained change between censuses.

District Summary
of
Census Totals

HISTORY OF BOUNDARY CHANGES AT DISTRICT LEVEL
(File: DEM. 00.6.2 and DEM. 00.6.3)

1. District

a. Code

b. Name

2. Page

3. Description

Source	Date Effective	1/ District involved in change	Code	Name	2/ (+) of area gained or (-) lost	Area in sq. mile 3/			Populations								
						Exis-ting	Gain-ed or lost	Revised 11+12	Previous Census		Sou- rce 5/	Next Census					
4	5	6	7	8	9	10	11	12	13	14		15	16	17	18	19	20

1/ The title of the column is: Type of change. For the meaning of codes used in the column see section 6 of the research proposal on 'History of Boundary Changes at District Level'. The first digit gives the type of change and the second the number of districts involved.
 2/ (+) = Gained) by district shown in items 1a and 1b.
 (-) = Lost)
 3/ Although for reasons of international comparison and for the purposes of final publication sq.km. is preferable, this working sheet is in terms of sq. mile, because most of the source information is in sq. mile.
 4/ Repeat sign from col. 9.
 5/ Whether particular source relates to the previous or next census is indicated by arrow.
