POLULATION PROJECTIONS FOR THE PESHLAWR
VALLEY: 1960-1990

by

Farhat Yusuf*
M. Naseem Iqbal Farooqi

INTRODUCTION

This is the second report on population projections which have been compiled by the Demographic Section of the Pakistan Institute of Development Economics at the request of the Town Planning Directorate of Peshawar Region, Government of West Pakistan. The requirements of the Town Planning Directorate were as follows:

- (i) Population projections by age and sex for each district and district headquarter town in Peshawar Division,
- (ii) Population projections for each agency of Peshawar Division and for each district/agency of Malakand Division.

*Dr. Yusuf is Senior Research Demographer and Mr. Farooqi is a Staff Demographer at the Institute. Neither the Pakistan Institute of Development Economics nor the Town Planning Directorate of Peshawar Region, Government of West Pakistan are responsible for the views expressed in this report. The authors will like to acknowledge the help of Mr. Mushfeq-us-Salaheen and Mr. Khurshid Alam Siddiqui of the National Bank of Pakistan for their assistance in programming and for making available their IBM 1401 Computer facilities for this Project.

...2...

In this report an attempt has been made to review briefly the available demographic data, the methodology and results of the population projections done for Peshawar Valley which includes all the districts and agencies of Peshawar and Malakand Divisions.

AVAILABLE DATA

As pointed out in our previous report we have utilized the data available from three sources - the decennial population censuses, the Population Growth Estimation Project (PGE) and the Population Growth Survey (PGS). Since the birth and death statistics from population census are usually very inaccurate, it was therefore felt desirable not to use them, however, the age-sex distributions and population totals from the census have been utilized. The census population totals together with the intercensal population growth rates have been used for estimating the extent of net internal migration in Peshawar Valley. In order to determine the fertility and mortality levels the PGE and PGS data were utilized. Two types of

...3...

PGE data were available. One based on the LR system and ² the other based on the Chandra-Deming (CD) adjustments. We have used the 1964-65 average of the LR and CD vital statistics for the PGE sample area in Peshawar Valley. Since the PGS fertility and mortality data have not been tabulated so far, we did some hand tallies in order to extract the relevant data for the PGS sample areas in Peshawar Valley. Strictly speaking the unweighted PGE and PGS sample figures may not represent the true situation in Peshawar Valley, therefore, for comparative purposes we have also considered the fertility and mortality estimates for West Pakistan based on the 1964-65 average of the LR and CD vital statistics of PGE.

METHODOLOGY

In order to estimate the population totals by age and sex breakdown for each district and district headquarter town of Peshawar Division we first projected the population of whole of the Division (excluding the ³ agencies) by using the component method with special

...4...

adjustments for the net internal migration in Peshawar Division. For the agencies of Peshawar Division and for the districts/agencies of the Malakand Division the population totals were projected by using the geometric growth rate formula.

Methodology of Population Projections for Peshawar Division Excluding the Agencies

For the application of component method we required the age-sex distribution, the age specific fertility rates and the age-sex specific mortality and migration rates for the base year 1960 and all these statistics except the age-sex distribution for the terminal year 1990 for Peshawar Division. The estimates for base year and the terminal year statistics were derived as described in the following paragraphs.

Base Year Population: Table 1 shows the per cent age-sex distribution for Peshawar Division as reported in the 1961 Census. Obviously, the census age-sex distributions could have been affected by misreporting of ages and problems such as the lack of coverage and age-sex selective under and in some cases over-enumeration. In the absence of any definite evidence about substantial lack of coverage and over or under-enumeration in Peshawar Division we did not make any adjustments in the total population. However, in

80+	1.53	1.26	1.16	0.94	24,046	18,023
ALL AGES	100.00	100.00	100.00	100.00	2,072,955	1,917,341

* The Census Organization gave the population figures for ten year age groups for ages 60 and over. The quinquennial age groups beyond this age were derived by using the formula given in United Nations op.cit.p. 15.

order to remove some of the distortions in the age⁴ distributions resulting from misreporting of ages we did smooth the age distributions for males and females by the moving averages. The smoothed age distributions are presented in the fourth and fifth columns of Table 1. It is evident that the process of smoothing did not make any substantial changes in the age distributions. In order to estimate the mid 1960 age-sex distribution for Peshawar Division we projected the 1951 Census population of Peshawar Division to the mid 1960 level by using the intercensal population growth rates separately for males and females. The resulting population totals were then distributed by using the smoothed per cent age distributions so as to get the mid 1960 age-sex distribution for Peshawar Division which is presented in the sixth and seventh columns of Table 1.

Base Year Fertility and Mortality Levels: Some alternate estimates of various fertility and mortality measures for Peshawar Division are presented in the second and third

TABLE II: ESTIMATES OF VARIOUS FERTILITY AND MORTALITY MEASURES
FOR PESHAWAR DIVISION AND WEST PAKISTAN

Parameters	Peshawar Division		West Pakistan++
	PGE*	PGS**	
Crude birth rate	53	33	47
Crude death rate	13	15	17
Total fertility rate	7.3	5.3	7.0
Infant mortality rates			
Males	80	168	123
Females	126	65	141

* Based on the unweighted average of 1964-65 LR and CD estimates for the PGE sample area in Peshawar Division.

** Based on the unweighted 1968 vital statistics for the PGS sample area in Peshawar Division.

++ Based on the weighted average of 1964-65 LR and CD estimates for West Pakistan.

...8...

columns of Table II. As pointed out earlier the unweighted vital statistics for the PGE and PGS sample areas may not necessarily represent the true situation in the Division. In order to determine the mid 1960 fertility level in Peshawar Division we assumed that the total fertility rate (TFR) for the Division was 7.5, that is, about 7 per cent higher than that for West Pakistan. Using the per cent distribution of the West Pakistan age specific fertility rates (ASFR) given in the second and third columns of Table III we estimated the ASFR corresponding to TFR of 7.5 thus arriving at an estimate of ASFR for Peshawar Division for the period 1960-1965. The ASFR for Peshawar Division given in fourth column of Table III yielded a crude birth rate of 45 per 1000 population. In order to arrive at a population growth rate consistent with the 1951-61 intercensal growth rate we had to assume a crude death rate in the vicinity of 20 per 1000 population. The age-sex distribution of Peshawar Division was such that only the North level 14 model life table for males and North level 11 model life table for females yielded a crude death rate of about 20 per 1000 population.⁵ Thus, these model

45-49	52.7	3.80	57.0	45.6
ALL AGES	1386.4	100.00	1500.0	1200.0
TFR	6.9	-	7.5	6.0

* Based on the average of 1964-65 LR and CD weighted estimates for PGE sample areas in West Pakistan.

life tables were assumed to represent the mortality schedule in Peshawar Division for the base period 1960-65.

Base Year Migration Levels: The net migration in West Pakistan compared to the total population is so little that one can safely assume that the population growth rate (PGR) and the rate of natural increase (RNI) are identical. Applying the intercensal PGR of West Pakistan (viz. 2.43 per annum) on the 1961 population of Peshawar Division, we estimated that the population as on the 1961 census date will be about 41,59,680 persons. However, the enumerated population in 1961 census was 40,39,655 persons. The difference between these two figures gave us an estimate of net out migration from Peshawar Division of the order of 1,20,025 persons between the 1951 and 1961 censuses. This yielded a net out-migration rate of -0.267 per cent per annum. With regard to the age-sex specific migration rate it was assumed that most of the out migrants are young men in the age range 20-39 years, who go out in search of job and usually leave their families and particularly their womenfolk in their home villages. Thus, we arbitrary decided that in the base period 80 per cent of the migrants were males and 20 per cent were females and that the migration rates were equal in all the age groups in the age range 20-39 years.

...11...

Assumptions for Future Population Growth: The following assumptions were made with regard to the components of future population growth in Peshawar Division:

- (1) The TFR would decline linearly from 7.5 for the period 1960-65 to 6.2 for the period 1985-90. The corresponding ASFRs were calculated by using the per cent distribution of the West Pakistan ASFRs given in the third column of Table III.
- (2) The improvement in mortality conditions during the period 1960-65 to 1985-90 will such that the expectation of life at birth for males will increase by 4 years and for females the increase will be around 7 years. The corresponding model life tables for the period 1985-90 were North level 16 for males and North level 14 for females. The mortality levels for the intermediate periods were interpolated linearly.
- (3) The net out-migration rate would decline exponentially from 2.67 per 1000 population per annum for the period 1960-65 to zero per cent for the period 1985-90 and will be applicable only to

persons in the age group 20-39 years. Moreover, the proportion of male out-migrants will decline from 80 to 50 per cent and the proportion for females will increase from 20 to 50 per cent during the projection period.

- (4) The sex ratio at birth was assumed to remain constant at 105 males per 100 females during the projection period.

Population Projections for the Districts of Peshawar Division

Table IV shows that the per cent age-sex distribution for the four districts of Peshawar Division were not substantially different from the per cent age-sex distribution for the whole division. This prompted us to project first the population totals for the individual districts by using the projected population growth rates for Peshawar Division and then applying the relevant projected per cent age-sex distribution of Peshawar Division to arrive at the population projection of the four districts by age and sex breakdown. This decision was taken in view of the nonavailability of demographic data needed for projecting the population by age and sex at the district level.

TABLE IV - DIFFERENCES IN PERCENT AGE-SEX DISTRIBUTIONS OF VARIOUS DISTRICTS FROM THE CORRESPONDING DISTRIBUTION FOR PESHAWAR DIVISION

Age	Hazara		Mardan		Peshawar		Kohat	
	Male	Female	Male	Female	Male	Female	Male	Female
0-9	-1.60	-0.37	0.23	-0.18	2.30	0.91	-3.62	-1.27
10-19	1.07	0.61	-0.94	-0.30	-0.39	-0.48	0.39	0.28
20-29	2.03	0.20	0.16	0.11	-2.24	-0.19	1.38	-0.24
30-39	0.07	-0.22	0.18	0.27	-0.44	0.05	0.89	-0.11
40-49	0.40	-0.03	0.17	0.04	-0.20	0.01	0.21	0.00
50-59	-0.06	0.22	-0.04	0.02	0.12	-0.26	-0.14	0.13
60+	-1.53	0.32	0.24	0.11	0.86	0.04	0.91	1.30

Population Projections for the District Headquarter Towns in Peshawar Division

The population totals for the district headquarter towns were projected by using the following population growth rates:

<u>City</u>	<u>1960-65</u>	<u>1985-90</u>
Abbottabad	11.7	11.7
Mardan	47.8	55.0
Kohat	20.1	20.1
Peshawar	37.2	50.0

The population growth rates were linearly interpolated for the intermediate period. Further, it may be noted that the population growth rates for the period 1960-65 were the same as the 1951-61 intercensal growth rates. For the cities of Peshawar and Mardan the 1961 census per cent age-sex distributions were used to estimate the projected age-sex breakdowns for these cities during the projection period. However, as the 1961 census age-sex distributions were not available for the cities of Abbottabad and Kohat, we used the per cent age-sex distributions of the urban part of the Hazara and Kohat districts to estimate the projected age-sex breakdowns for these cities during the projection period.

-
6. The rates are given per 1000 population per year.

Population Projections for Agencies of Peshawar Division
and for Districts/Agencies of Malakand Division

The projected population growth rates for Pehsawar Division were used to arrive at the population totals for agencies of Peshawar Division and for districts/agencies of the Malakand Division.

RESULTS

Tables V and VI present the population of Peshawar Division from 1901 to 1961 and the projected population totals from 1960 to 1990. It appears from Table V that the population of Peshawar Division doubled itself in less than 50 years between 1901 and 1951, while we estimate that it will again be doubled in less than 30 years between 1960 and 1990.

Some future estimates of various demographic parameters for Peshawar Division are given in Table VII. The table shows that the crude birth rate in Peshawar Division will decline by about 12 per cent, while the crude death rate is expected to decline by around 32 per cent - this will enhance the rate of natural increase by more than 3 per cent during the projection period. Further, as the net out-migration rate has been assumed to decline to zero the net effect of declines in fertility, mortality and migration levels will result

TABLE IV: PAST POPULATION TRENDS FOR PESHAWAR DIVISION: 1901-1961

Year	Population*	Percent change in population
1901	15,66,860	
1911	16,90,727	7.91
1921	17,43,839	3.14
1931	18,80,711	7.85
1941	24,44,006	29.95
1951	32,73,016	33.92
1961	40,39,655	23.42

*The population totals are as on the census date.

TABLE VI:PROJECTED POPULATION TRENDS FOR PESHAWAR DIVISION:1960-1990

Year	Population*	Percent change in population
1960	39,90,296	
1965	44,56,510	11.68
1970	49,61,878	11.34
1975	55,40,858	11.67
1980	62,26,385	12.37
1985	70,43,716	13.13
1990	80,03,254	13.62

* The population totals are as on 01 July of each year.

in the acceleration of the rate of population growth by more than 5 per cent. The improvement in mortality conditions will be such that expectation of life at birth for males could increase by more than 4 years and for females by about 7 years. The other measures of fertility and reproduction also show declines of the order of 8 to 20 per cent.

Tables A.1 through I.3 give the projected age-sex distributions for Peshawar Division, the 4 districts and the district headquarter towns of Peshawar Division, while Table J gives the projected population totals for the districts/agencies of Malakand and agencies of Peshawar Division. Tables K through V give the estimated abridged life tables for Peshawar Division.
