    (Cambridge Journal of Economics, June. 1978)
    AMIYA KUMAR BAGCHI
I have been associated with a research project on 'Foreign Investment, Import of Foreign Technology and Development of Indigenous Technology In Indian Industry', under the supervision of Amiya Kumar Bagchi, Professor of Economics, at the Centre For Studies In Social Sciences, Calcutta. In this project I have concentrated on the study of the electrical equipment industry. This paper is the third in the series of articles, written by me with the data collected for the project. The present paper was presented to a symposium on 'Transnational Corporations And The Third World Development', organised by the Indian Institute of Management, Calcutta and the Centre For Studies In Social Sciences, Calcutta, on March 21, 1980. I am grateful to Amiya Kumar Bagchi and Partha Chatterjee for the corrections made on an earlier draft of the paper. I am indebted to the members of staff of the libraries of the Dajmodar Valley Corporation, Calcutta, the Federation of Indian Chambers of Commerce and Industry, New Delhi and the Indian Council of World Affairs, New Delhi, for invaluable help rendered by them in the collection of data.

CONTINUITY OF LINKAGES: A STUDY
ON TRANSNATIONAL CORPORATIONS IN
THE ELECTRIC POWER SECTOR OF INDIA,
1947 - 1967

Introduction

Studies on transnational corporations occupy an important place in the understanding of the modern phase of the economics of imperialism aid of its influence on the course of economic development of the ex-colonies which have earned independence in the middle of the twentieth century. The electric power sector constitutes a vital force behind the economic developments any country. In the course of import of technology for development of the electric power sector a typical third world country becomes linked—rather asymmetrically with transnational corporations, advanced capitalist countries and international financial organizations. With the course of time, the type of linkage changes but it does not end; there remains a continuity of linkages how different the form may be.

The empirical evidence, on which this study is based, relates to the power sector of India in the first two decades since political independence, that is, between 1947 and 1966-67. The study is divided into four sections. The first section deals very briefly with the electric power equipment industry of the world and the position occupied by the transnational corporations. The second points out the role played by the transnational corporations in the construction of power plants in India. The linkages established between the transnational corporations and the private sector in India in the manufacture of electric power equipment is the subject matter of the third section. The fourth section shows the linkages of the transnational corporation with the public sector in India in the manufacture of electric power equipment. On the basis of the evidence put forward in the last three sections this study tries to build up the framework of the continuity of linkages. One point needs to be clarified in the context of the scope of the study: it excludes any kind of cost-benefit analysis and comparative study of the degree and form of linkages or dependence in the different stages of activities. It just shows that the linkages with the transnational corporations continue.
with different forms of activities in the electric power sector of India. For example, construction of power plant, manufacture of electric power equipment in the private sector and in the public sector. The mere change of activity does not signify that the economy is out of the orbit of the operation of transnational corporations.

**Electric Power Equipment Industry In The World.**

The electric power equipment industry in the world is characterised by three important features. Firstly, the industry is dominated by a very few big transnational corporations, mostly originating from the United States of America. The West European firms, except a few, and Japanese firms are dependent on the 'industry leaders'. All the major firms are interlinked with one another in several ways. Secondly, excess capacity, large capital requirements for research and development, high overhead costs, fluctuating demand and the fear of competition led to the international 'Cartel-type' agreements of the transnational corporations. Foreign markets attracted the attention of the dominant firms very early in the development of the industry. The world's major firms appreciated the advantages of restraining international competition as early as 1900, and entered into agreements that successfully cartelised much of the industry's world trade. Although secrecy surrounds most cartel arrangements, reports and cartel contracts reveal that the cartel set prices, allocate markets, and set quotas and compensations for members as well as engage in predatory practices against outsiders. Thirdly, the main emphasis in the electric power equipment industry is on the continuous increase in the size of the electrical system. At the beginning, the main thrust of technological 'progress' has been in the capability of designing and producing the 'ever larger equipment'. While in the larger units the leaders of the industry nearly dominate the world market, in smaller sizes, technology is more widespread, even accessible to producers in developing countries.
Linkages of Transnational Corporation with the Third World Countries.

The transnational corporations establish linkages with the third world countries in two forms. One form is the export of design and equipment in the construction of electric power plants in the third world. The other form is export of technology for the manufacture of electric power equipment in the third world.

The first form of linkage is determined mainly by three factors, traditional and political ties, tied credit and the relation between consultant engineers and equipment manufacturers.

Trade linkages of transnational corporations with third world countries arise from traditional ties or previous political association, such as language, education and experience of administrators and engineers, existing equipment, trade channels, etc.  

'The second politically-directed group of sales is in areas where direct political ties have weakened. The determinants of export success here are the export of credit and economic aid offered by the governments and the financial organisation of the sellers' countries'. The development of electric power on the model of developed countries requires huge capital. This type of investment has a large foreign exchange components. Third world countries generally have small capital resources, their foreign exchange reserves being even smaller. Their purchasing policy thus appeals to be to seek external credit resources. Soon after World War II, countries that previously had been tied to Western Europe found that the electrical equipment manufacturers in Britain, France and West Germany were fully occupied in rebuilding their own electricity networks. They could supply neither equipment nor engineering advise for new systems nor funds with which to build power stations. The United States was in the best position to provide equipment and financing. It did so in the form of development grants and loans. "The most relevant of these, now, are the development loans granted by the Agency for International Development ... In the late 1950s ... West European countries again were actively seeking export orders ... In order to compete for power projects" in developing
countries, the European developed programmes that combined aid with commercial credit. These involved combining government development loans with commercial credit. When the German heavy electrical equipment manufacturers are bidding for a project, their offer can be backed by a government development loan. Austria, France, Italy and Japan also have instituted government programmes facilitating export credit. Apart from governmental sources, private or intergovernmental financial sources such as the World Bank play an important role in the financing of the electric power plants in the third world countries. Several conditions are attached to the loans. Official bilateral sources are usually tied to the purchase of the capital equipment from the donor country. For example, half of the United States heavy electrical equipment exports in the 1960s were sold under Agency for International Development loans. Obviously, the heavy equipment producers, the transnational corporations are natural supporters of bilateral aid programmes. Projects financed by the World Bank are subjected to international tenders. International bidding tends to favour the well known firms in this business.

Planning and construction of the electric power plants in the third world countries in imitation of the prototype of plants in the developed countries requires, as 'chain-effect', expertise in civil, mechanical and electrical engineering, equipment design and project management of the developed countries. Accordingly, the task is undertaken as turnkey project where a foreign contractor is generally in charge of the whole project. All technological decisions are in his hands, including the participation of foreign and local sources for the provision of equipment, materials and technical services. The country usually receives the product, a power station, rather than the technology. In some extreme cases, the so-called, product-in-hand project, the foreign contractor even takes care of the provision of services for the current operation of the plant. The consultant engineers in most cases are linked with the transnational corporations in power equipment. So, they take advantage of their position and place the order with the associate transnational corporation without looking for more competitive sources of equipment or expertise.
"Development of power projects in the nature of developed countries, the political and ec enemies ties existence of cartel arrangements, the provision of equipment linked to aid schemes, are the important factors explaining the control of the third world countries' market by the transnational corporations in power equipment.

The linkage of transnational corporations with the third world countries is not limited to trade only. It extends into their participation in the manufacture of electric power equipment in these countries. The latter is the outcome of two sets of factors. The first set consists of policies of the governments of third World countries favouring the setting up of woioctrio power equipment industries. The second is the interest of the transnational corporations in keeping a foothold in the market of third world countries. Governments of third world countries have shown their vital concern in the initiation of this industry by giving it a prominent place in their development plans. The international companies were taken by surprise. Almost without exception, the international firms question the economics of heavy electrical equipment manufacture in developing countries. Theoretically if they had realized the determination of the developing countries to build these industries they might have devised some scheme for sharing the markets. The linkages established on the basis of this motive are of two types. One is in the form of establishment of subsidiary firms, sometime by way of acquisition of already existing firms and the other is a joint venture with the local entrepreneur in the form of technical and financial collaboration. Obviously, not all of this variance can be explained solely by informal and formal market allocation strategies of transnational corporations. Other factors influence (the participation in the manufacture in the third world countries), such as special currency areas, preferential trade agreements, transportation and communication costs, historical ties and perceived risks.

We would now analyse the electric power sector of India, being the second largest market among the third world countries in this structure of linkages between the transnational corporation and the third world countries.
Electric Power Sector In India

The story of electric power development in India's Five-Year Plans is told in the study by K. Venkatraman, the then Director in the Ministry of Industrial Development, Government of India, and Special Assistant to the Minister for Industrial Development. With the beginning of the First Five-Year Plan, electric power development programmes received a fillip, but the progress of power programmes during the period (1951-52 to 1955-56) was described by the Second Five-Year Plan document as only fairly satisfactory. This was because, among other things, considerable delay was experienced during the early stages, and the country was dependent on imported machinery and equipment for generation and transmission of power, and delays occurred because of protracted deliveries from foreign manufacturers. The Third Five-Year Plan document ascribed the shortfall mainly to foreign exchange difficulties that arose during the early years of the Second Plan. To avoid severe power shortage in the early years of the Third Plan, steps were taken to provide foreign exchange for implementing the remaining power schemes of the Second Plan. It was clear that even during the Third Plan, a large proportion of the machinery and equipment would have to be imported. Again, according to the Fourth Plan document, power supply at the end of the Third Plan remained unsatisfactory. The reasons were said to be first, procedural delays in getting the projects finally accepted by foreign aid-giving agencies since they were tied-up in principle with foreign credits; secondly, the shortage of free foreign exchange for import of ancillary equipment not covered by foreign 'aid'; thirdly, procedural delays in the appointment of consultants; fourthly procedural delays in placing orders for equipment; and fifthly, delays in deliveries of equipment from certain countries. This review of the achievement in the power sector of India during the plan period reveals some important points: the Indian government had appointed foreign consultants for the construction of the power plants, had imported machinery and equipment for the power projects, had received foreign 'aid' for the development of the power sector. This was the result of the fact that India had followed the path of developed countries for her power sector. As India had no technological base
for the construction of big power plants, transnational corporations were in the scene as the consultants and suppliers of equipment as India did not have sufficient foreign exchange resources to finance the power plants—foreign countries and the foreign aid-giving agencies were in the sense as doors.

Dependence On Foreign Sources : Financial Aspect

The degree of dependence on foreign financial sources could be illustrated by the fact that out of about 70 power projects commissioned upto the end of the Third Plan, nearly 75 percent of the projects were tied to foreign aid programmes.^

There are two types of sources of foreign exchange loans—foreign governments, and foreign financial institutions. For intensive discussion we take one foreign source of finance, namely, the United States of America as a case in point. Commencing in the first financial year of India's First Five-Year Plan, the Indo-US Technical Co-operation Programme had been closely associated with the development activities of India in various directions. Power was one of the fields for which projects were aided by the programme. The US contribution in dollars was utilised to meet the foreign exchange cost of equipment needed for the power plant projects as well as services of foreign experts and training facilities abroad for Indian technicians. In order to realise the nature of assistance a few cases of agreements between the two governments of USA and India on the power sector can be cited from the reports on the Indo-US Technical Co-operation Programme.19

1. Agreement No. 11 : Project For River Valley Development (1952)

The purpose of the project was to provide technical assistance and heavy equipment to help with dam, canal and power house construction of the schemes at Hirakud, Kakrapara, Mahi, Ghata Prabha, Tunga Anicut, Chod Wair, Chambal, Pathri. Total US contribution upto 30 June 1966 $7-917 million.
Agreement No. 20: Rihand Valley Development (1954)
The purpose of the project was to generate power with the help of a dam on the river Rihand and a power house with an installed capacity of 250 m.w. The Indo-American programme assisted in the first phase of the project which included construction of the initial power plant, switchyard installation and a major portion of the transmission system. The agreement provided funds in US dollars for the procurement of construction and laboratory equipment and supplies from outside India and their transmission to India and for meeting the costs of technical services from outside India. Material and equipment worth $5,903,457.57 were received upto March 31, 1959.

Agreement No. 23: Project For Improvement of Rajasthan Power Facilities
The purpose of this project is to assist the renovation and augmentation of the 19 state-owned thermal power stations in Rajasthan and extension of transmission and distribution lines to distribute additional power to be provided. Material and equipment worth $1,046,041.58 were received upto March 31, 1959.

Agreement No. 56: Project For Technical Services for Water Resources and Power Development (1956) The purpose of this agreement was to provide technical assistance and advisory services to the Central Water and Power Commission, New Delhi for the development of power resources. There was a provision for making available the services of 21 engineers, 13 short term consultants, a third country's technicians, a construction plant and equipment adviser, a hydraulic engineer and 2 heavy construction equipment specialists to advise and assist the Commission.
Oho of the important channels of credit from the USA was the Agency for International Aid (AID) and its predecessor was the Development Loan Fund (DLF). The credit was extended for the import of capital goods, equipment and spare parts and related services for specified projects. The extent of loan granted by these two US financial agencies for the electric power sector of India can be realised from Table 1.

The data presented here relate only to the early phase of the development of the power sector in India. However, this trend continued afterwards. The magnitude of US credit in the power sector in India is indicated in a document of 1970. Of the 16 million kilowatts of power-generating capacity available at that time, as much as one-third was accounted for by the 30 power projects aided by the United States.

Among the other countries that extended loans for the power sector in India in the initial phase (upto 1967-68), Britain granted Rs.58 million on account of equipment and services for power stations in east and central India. Federal Republic of Germany rendered a loan of Rs.144.2 million for alternatois and power equipment and Japan supplied Rs.556.5 million for power and transmission equipment in Durgapur, Kosi, KuttiadiUmiam, Gauhati and Jaldhaka projects.

Dependence On Foreign Sources: Technical Aspects.

The foreign financial sources brought with them some restrictions and pressures, directly or indirectly. For example India had to spend the aid funds for importing goods and services only from designated sources. Even without an explicit restriction, the donor countries had an advantage in tendering for, or supplying the specified item, and services. By exploiting this advantage, transnational corporations of power equipment of donor countries established their linkages with the electric power projects in India. Of the 30 power projects in India aided by the United States, 20 projects were equipped with electric power equipment products of the United States. This feature is substantiated by the data on import of electrical equipment from different countries, which also extended foreign exchange loan for the power sector in India, furnished in Table 2. (one point is to be noted regarding the data presented is that—the figures include not only the imports of generating and transmission equipment, but also equipment and machinery for the establishment of heavy electrical equipment manufacturing plants as well as all other electrical apparatus and appliances, as no separate data for power plant equipment is available).
The impact of this linkage is felt on several aspects of the power sector of India. One of the important aspects was that the power plants financed by tied credit and constructed with design and equipment from transnational corporations had a continued dependence for spare parts on the concerned transnational corporation. The Estimate Committee of the Eleventh Lok Sabha, in their report on the power sector had compiled comments from different quarters on this phenomenon.\textsuperscript{22} The Member (Thermal), Central Water and Power Commission stated during evidence, "when we place an order with a foreign firm for a particular item the foreign supplier cannot always supply the same from the shelf. Sometimes they have to

\textsuperscript{22} The Member (Thermal), Central Water and Power Commission stated during evidence, "when we place an order with a foreign firm for a particular item the foreign supplier cannot always supply the same from the shelf. Sometimes they have to
manufacture it and supply it. That necessarily takes 3-4 months\(^1\). In a memorandum submitted to the Committee by a State Electricity Board it was mentioned that "many of the existing power plants are suffering for want of adequate imported spares." The Minister for Irrigation and Power stated in the Lok Sabha on February 28, 1973, regarding the spares for the generators that, 'mainly the machines (generator) are from the USA and West Germany. There were some machines in Delhi and Talcher imported from International General Electric of USA, which were held up for spares. We got these spares unfortunately these machines got broken, may be due to faulty design. Any way, it is too late in the day because the guarantee period is over. The machines have been waiting for spares for nearly 5 to 6 months. The worst thing was in Durgapur. There were two West German machines in Durgapur and one at Bokaro, waiting for the spares— for some time'. \(^2\) In respect to the efforts made to substitute indigenous spares, the representative of the Bharat Heavy Electricals stated that, "the manufacturing plants have the main difficulty of not being able to get the manufacturing design and production plans for spares which have been imported... The plants are manufacturing to a certain design and the imported equipment may be of a different design. These design drawings and production drawings are not really available to the manufacturing plants."

In order to understand this type of impact of the linkages between the transnational corporations and the power sector in India, we now turn our focus from the general sphere of the power sector in India to a particular power project—the Damodar Valley Corporation, for an intensive look.

Impact of Linkages: A Case Study: DVC

Linkages do not start only from the desire to produce more electric power. Even schemes with a wider perspective such as multipurpose river valley development lead to the introduction of foreign firms into the sector. This is illustrated with the case of the Damodar Valley Corporation (DVC) which will first attempt to describe the circumstances that created the background!
for the transnational corporations to establish linkages with the DVC. It can be seen that from the very inception of the DVC foreign political and economic powers have determined the course of the project.

DVC formally came into existence in July 1948. One of the declared functions of the Corporation was, "the promotion and operation of schemes for generation, transmission and distribution of electrical energy, both hydro-electric and thermal". In August 1944, the Government of Bengal forwarded a copy of the report of the Pambodar Flood Enquiry Committee to the Government of India for consideration. R.G. Casey, then Governor of Bengal followed it up by a letter to the Viceroy dated September 1944 in which he suggested that the whole subject should be surveyed by high level experts. He commented that, really high level man or men from say, the United States should be obtained and added, "that, I assume that there is no one in India who could advice us on the highest level."

It is to be mentioned in this context that one of the first few to draw public attention to the Damodar issue and the person who insisted on a comprehensive solution was an eminent Indian scientist, Meghnad Saha, who was a member of the Damodar Flood Enquiry Committee. The Government of Lord Wavell appointed W.L. Voorduin, a senior engineer of the staff of the Tennesse Valley Authority (TVA) of USA, for a term of three years with the assistance of Mr. Lilienthal, Chairman of TVA. Voorduin appointed as the hydro-electric member of the Central Technical Power Board to study the problem of the Darnedar and to make recommendation for its comprehensive development. Accordingly, in August 1944, he submitted his "Preliminary Memorandum on the Unified development of the Damodar river System". The unified scheme was also...amine by the four consultants appointed by the Government. Two of them were Ross Reigel and Ered Schlemmer, US engineers, especially brought out to India. Before leaving India, Voorduin had drawn up an "Invitation for Preliminary Proposals on the Designs, Purchase of Materials and Equipment and Supervision of Construction of the Dams under the Damodar Valley Project". In August 1948, the DVC issued the invitation to reputed foreign firms of consulting engineers and contractors. In addition, proposals were placed through the British Trade Commissioner, French and Italian embassies and Swiss
and Swedish legations in India. By October 1948 replies were received from 30 foreign firms, the bulk of which came from the USA. Hence, the transnational corporations got the opportunity to penetrate into the power sector in India and the linkages were established.

Technical Aspects.

The Central Technical Power Board of the Government of India first set the ball rolling for the steam power plant. Its successor, the Central Electricity Commission (CEC) continued the work. At the initial stage, DVC made use of the CEC’s set up for the project. CEC drew up the preliminary plans and specifications, invited tenders from American and European manufacturers in 1948, analysed them and made recommendations to the DVC. On the basis of these recommendations the tender of the International General Electric Company (IGE) of the USA, the biggest transnational corporation in the power equipment industry, was accepted, and a contract was signed with them for a thermal power plant at Bokaro, with an initial capacity of 150,000 Ks. Similarly, on CEC’s recommendation the Kuljian Corporation of the USA was appointed as Consulting Engineers of the DVC. Kuljian was initially employed by the IGE for the engineering work needed for the preparation of its tender.31

The interlink between the consultant engineer and the construction firm is well established by the following facts.

- The DVC decided in October 1948, to separate the functions of consulting engineers and construction firms in respect of dam design, so that consulting engineers might act on behalf of the DVC and not of the IGE. A series of discussions were held with the representative of the IGE and the Kuljian Corporation. On the part of the concerned parties, the following points were raised (a) IGE’s own engineers and the Kuljian Corporation had been working together on the plans and specifications for the Bokaro thermal power station so that a line of demarcation between the two could not be easily drawn. (b) IGE would still require the services of consulting engineer
for coordinating their own equipment with those of other manufacturers so that they could not entirely dispense with the services of the Kuljian Corporation and (c) the plans and specifications had already progressed so far that any separation at that stage would create dislocation in the process of the work'. The IGE had also made it clear that it was their intention to engage the Kuljian Corporation on construction management and initial operation of the Bokaro Station in case UVC decided to entrust them with this work as well. The IGE further confirmed that their warranties for the satisfactory operation of the equipment supplied by them would remain "fully effective" if the services of the Kuljian Corporation were utilised for the purpose.

The significance of this interlink can be realised if we analyse the scope of the work of consulting engineers. In the contract between the DVC and the Kuljian Corporation, USA, for engineering and construction supervision services of the 4th Unit extension of the Bokaro thermal power station it was prescribed that.

The consulting engineer shall (a) review/scrutinize -

i) all necessary tender specifications before issue

ii) the bid analysis and purchase recommendations

iii) all contracts and orders before placing the orders-

iv) cost estimates, the bill of materials, basic flow and key diagrams, heat balance sheets, general plant layout, detailed drawings, all construction drawings, investigations, reports, if any, furnished by the owner-

v) vendors' drawings

vi) calculations, detailed drawings of all equipment layouts, piping, wiring, supports/Imulation, structural modifications, additions and alternations to foundation facilities and substations.
vii) results of acceptance test reports on the plant and equipment

viii) progress schedule

ix) monthly progress reports and cost reports

tax) construction programme.

i) organising and establishing construction plant

ii) recruitment of local personnel for the construction programme

iii) establishing field accounting system

iv) establishing field store system.

(c) supervise

i) contracted or subcontracted work

ii) work carried out with field force

iii) manufacturer's erectors services.

It is quite clear from the scope of the function of the consulting engineer that the selection of the type of equipment and source of equipment were under the control of the consulting engineer. It is obvious that those would be determined by such factors as the standard of equipment as are in operation in the home country of consulting engineer, the relation between the consulting engineer and the manufacturers of equipment.

The dictation of the type and source of equipment can be indicated by another document. In a letter to the Chairman of the DVC. the International General Electric Co. (India) Ltd., wrote that, 'we are pleased to inform you herein of the materials which in addition to those included in the purchase contract, must be procured from the United States for successful and timely caipletion of the Bokaro Thermal Power Station.
In addition to the comments given for each group, we would emphasise that our design of the power plant is based on electrical and mechanical equipments conforming to American standards and practices and any delay or failure to order additional critical materials from the Us will retard the progress we have already made on the design on this basis, seriously upset the construction schedule and consequently delay putting of the station into operation —

1) Building Structural steel— our design is based on American Structural shapes, many of which particularly the heavy sections, are not available outside the United States.

2) Power and Controls Cables, Conduit and lietal Enclosed Main Generator— Just Ducts — Our station design is based on American practice standard, American dimensions and ratings which are not available elsewhere.

3) Elevator — Freight elevator shaft will be designed to American standards.

enée, as the project was based on the example from the USA, consultants engineers were appointed from the USA? the consulting engineers being from the USA would select equipments from the USA? as the main equipments were based on American standard, the ancillary equipments had to be imported from USA.* It was pointed out in the report of the Rau Commission that, it had been planned that the foreign big firms would be appointed for all the power projects in exchange of payment for construction cost and technical fees.
financial Aspects.

The linkages between the transnational corporations and the DVC resulted in, the linkages between foreign financial sources and the DVC. On the other hand, the linkages between foreign financial sources and DVC determined the linkages between the transnational corporations and the DVC.

It was mentioned in a Memorandum in 1949 that, 'the Damodar Scheme has reached a stage where further progress is conditioned by the availability of an adequate dollar loan'. As the Government of India did not have a substantial reserve of foreign exchange to support this huge investment, 'a dollar loan, if granted to the Corporation to cover this amount will help relieve the strain on the limited dollar exchange resources of the Government of India. Hence, 'for the further progress of the scheme the urgency of immediate sanction of an adequate dollar loan can hardly be over stressed'*

As a source of Dollar loan the World Bank was approached. In August 1949, the World Bank sent out Mr. A-D. Spottswood to make a thorough technical and economic study of the Bokaro steam Power Project. Mr. Spottswood spent about a month with the Corporation, during which time he also visited 'the project sites in the valley.'

On April 1950 two agreements were signed. One was the "Loan Agreement (Bokaro-Vonar Project) between India and IBPD" and another was "Project Agreement (Bokaro-Vonar Project) between IBBD and DVC". Under the Agreement the World Bank has extended to the Government of India a loan amounting to $18,500,000 to meet the estimated foreign exchange requirement of the Bokaro-Vonar Project as from January 1, 1950. In 1953, Government of India obtained a second loan from the World Bank for Maithon, Panchet. In 1958, a third loan of the amount of $22 million dollar for the Bokaro Thermal Power Project (4th Unit) and the ruragapur Thermal Power Project was obtained from World Bank.
The Development Loan Fund, an agency of the Government of the United States of America, now known as the Agency for International Development, has also extended loan to this sphere. In an agreement on June 30, 1960, the said Agency agreed to provide $30 million to meet foreign exchange requirements for the equipment, materials and services required to construct Chandrapura Project. The extension of one unit of 140 MW capacity to Chandrapura Thermal Power Station was also covered by the AID Loan, amounting up to $16 million for the foreign exchange cost of goods and services of the project, according to an agreement signed on October 21, 1963.

Another agency of the United States, the International Development Authority, also granted loan of $18.5 million to cover the foreign exchange cost of the 'Fourth DVC Project' i.e., Durgapur Thermal Power Station, Transmission System, Extension of substation.

Foreign loan was received not only from the USA, but also from European sources, as there were consultant engineers, construction firms and equipment suppliers from different European countries.

The features of tied aid has already been discussed. Transnational Corporations sold equipments to the projects, financed by sources originating in their home countries. For example, the amount of loan received for Chandrapura Project from the AID of the USA was $30,000,000. whereas, the payment made by the DVC to the firms of the USA for the equipments procured for the project was $29,210,000. Similarly, the amount of loan received for Chandrapura Project II from the AID of the USA was $16,000,000. whereas, the payment made by the DVC to the firms of the USA for the equipment procured for the project was $10,707,119.

The interest of the loan-giving agency does not cease with the payment of loan. It 'keeps a close and continuous match on the progress of the undertaking. Airin' the entire life of the loan and does not hesitate to bring to the notice of the authority concerned any defects and short comings which would affect its utility or impair its soundness.47
The aid-giving agency took a keen interest also in the appointment of the consultant engineer. One example was that IDA approved the appointment and the scope of the services of the Bruce & Roe Inc. of the USA as the consulting engineers for the extension of the jCurgapur Thermal Power Station in 1962. A representative of the B&R had to review all the bids for engineering designs and procurement of equipments. B&R sent final recommendation from New York. Another example was that the World Bank helped in the final selection of the Chief Engineer of the D7G. A.M.Komora was selected and joined the WC in December 1950. Komora worked in the Consumer Power Company, USA, Commonweal Southern Corporation USA, flowers it Edison Co. USA and Tennesse Valley Authority — USA. The relation between the foreign consultant engineers and the transnational corporations has already been discussed.

Hence the circle is complete. As the power projects were planned according to the prototype of the developed countries, so the consultant engineers were appointed from developed countries. Foreign consultant engineers were linked with the transnational corporations in the electric power equipment industry. Equipment for the power projects were imported from the transnational corporations. It needed huge foreign currency. Third World countries did not have sufficient foreign exchange reserves. Foreign financial sources were approached. Foreign agencies gave loans. Donors were tied—credit. Consultant engineers were to be appointed from the donor countries. Consultant engineers were linked with transnational corporations. With the loan given equipment and services were to be taken from the loan giving countries where the transnational corporations dominated the manufacturing sector.

This explains the linkages established between the transnational corporation and the power sector of the third world countries through trade.

Linkages Of PNGs With The Power Equipment Manufacturing Sector In India. ! Private Enterpriser

"The circle breaks with a new element - the manufacture, of power equipment in the third world. A new form of linkage between the transnational corporations and the third world countries is being. This new form is a culmination of
of initiatives from two quarters - the transnational corporations and the entrepreneurs in the third world.

We intend first of all, to trace, in a very brief manner, the factors behind the motives of the international firms for entering into the manufacturing sector in India. The transnational corporations always try to keep a foothold in every market, both old and new, in all possible ways except when for strategic reasons, one transnational corporation keeps itself out of the market of another. The Government of India adopted import restriction policies in the 1950s. The exporting transnational corporations had to seek a new way to keep the 'old' markets for their commodities. They also tried to enter the new expanded market created by huge public investment in compliance with the industrialisation policy of the Government of India. They devised some schemes for sharing the market. The schemes were 'collaboration' with the Indian entrepreneur, establishing subsidiaries in India and acquisition of existing Indian firms.

The factors that led the Indian entrepreneur to establish linkages with the transnational corporations were the industrial policy of the Government of India, strong xenophilia of the Indian consumer society, and the pressure from foreign financial institutions.

After 1947, the nature of industrialisation that the Government of India wanted to foster was a copy of that of the developed countries. This needed technology and capital. But there was no programme for the development of indigenous technology. On the other hand, the Indian entrepreneur had already established linkages with the transnational corporations as importers and exporters respectively. Under the influence of the Government of India's import restriction policy, the Indian importers for the sake of survival had changed the form of their enterprise from trading to manufacturing. As manufacturers, they wanted to hold the same market they controlled, with the same products, already known to their customers. The gambit of the Indian entrepreneurs was to manufacture the product with the same technology as used by foreign manufacturers, which were the previous exporters, and this was the easiest way of remaining in the same market.
To the new Indian entrepreneurs, the information regarding the world market of technology was limited. They were not in a position to enquire as to whether the technology could be purchased outright. On the other hand, the transnational corporations did not sell technology, machinery and processed raw materials as simple merchandise; they demanded either the payment of royalties etc. for their utilisation or in most cases, they converted these goods into capital and introduce them in the form of their own investments. This fact led the Indian entrepreneur to take the transnational corporations as partners in the production.

India's strong xenophilia of the Indian consumers. Indian firms had to rely on foreign brand names. Without them they would almost certainly have lost out in competition with new entrants to the industry who loaded the foreign names Che of the reasons is "that, almost invariably, an imported article is ipso facto preferable to one made in India and commands a higher prices: a foreign brand manufactured locally by a foreign firm is better than one made by an Indian firm: and so down the line with decreasing value accompanying receding foreignness. This alone is a strong inducement, for Indian firms to seek foreign links".

The other important factor favouring the foreign sources, as we have already mentioned, is the reliance of the Government of India on foreign financial institutions. We will discuss the reliance of Indian firms on them subsequently. These institutional credits mainly assist the enterprises dominatedty, or in contact with the transnational corporations.

We now shift our attention from the general economic situation to the particular case of the power equipment industry in India. In a Government Report on electrical equipment published in 1947, it was mentioned that a team of American experts, Messers Ford, Bacon and Ikvis, were asked by the Government of India to report on the manufacture of industrial machinery and equipment in India. Their comment, included in that Report, was as follows: "Industrialisation in India would be expedited if the designs worked out in other countries could be secured for manufacture in India with such modifications..."
ag my be necessary to adapt the products to the peculiar conditions existing. Many products are protected in other countries by patents but generally it is possible to negotiate for the use of patents, licences and acquisition of working, drawings and specifications. The Government Panel adopted the same view.

Thus, the factors discussed above, together created an opportunity for the establishment of the linkage between transnational corporations and the power equipment manufacturing sector in India.

Through Joint Ventures.

We would first discuss the nature of linkage through joint ventures of the transnational corporations and the Indian entrepreneurs. On the basis of typical collaboration agreements in the power equipment manufacturing industry, we would attempt an analysis of the process and mechanism of linkages between the Indian companies and the transnational corporations. (The quotations that are used to substantiate our analysis if not otherwise stated have been taken from actual agreements). In these agreements were written what the Indian company would acquire from the foreign company, as well as what the former would be able to do, and what it would not. In a sense, the collaboration agreement becomes the 'charter of linkage'.

The Indian entrepreneur either controlled a company before the collaboration or would form a company after collaboration. In cases of collaboration agreements involving financial participation, the foreign collaborator obtained a representative on the board of directors of the company. In one agreement it was stated, for example, that, the transnational corporation shall have the right to nominate two directors. Out of the Directors to be nominated by 'the transnational corporation' one shall work as the Technical Adviser of the Company and shall be in charge of the technical management including designing manufacturing technique and progressive development of production technique in close cooperation with 'the transnational corporation'.
Then the Indian company (hereafter referred to as IC) aimed at manufacturing the scheduled products. What it needed first was a project report.

In a typical collaboration agreement, it was mentioned that the transnational corporation (hereafter referred to as TNC) "agreed to furnish or make available to the IC" following information relating to the establishment of a transformer manufacturing factory by the IC:

i) Layout of factory buildings with other design information including drawings and plans of the main and auxiliary buildings, so as to enable the Indian architects to prepare detailed drawings and estimates.

ii) Layout of machinery and equipment to be installed in the factory buildings, indicating requirements of power, water and air at several points.

iii) Foundation drawings of special machinery and equipment.

iv) General layout of power substation equipments.

v) Specification lists for the purchase of machinery and equipments, transportation equipments, power substation equipments, tools, and stationary facilities.

vi) Advice relating to the establishment of the factory.

So the factory was built. The Indian entrepreneur was then faced with the question as how to produce. He needed the process knowhow, and got it from the foreign collaborator. In particular supply and deliver the following technical data:
(a) Standard manufacturing drawings, hills of materials and material specifications covering the said products.

(b) Current manufacturing methods (including process sheets and operation timing) and assembly practices and techniques (including confidential processes and methods) as known to "TNC 7 relating to the manufacture of the said products.

(c) Current test and inspection procedures as known to "PRC 7 in connection with the manufacture of the said products".

To another IC the followings were furnished by the TKC: Design Drawings, Design Sheets, General Data on Process Control, instruction Manual on forking, Production Han. But the IC will have "to use all drawings, specifications, technical information and data supplied by /"TNC 7 hero under only in connection with their manufacture and sale of scheduled products."  

a. So the Indian Company got the process knowhow. It came to know how to produce. After that it needed machinery and equipment to manufacture the scheduled products. The source for these was also often the foreign collaborator.  

Firstly, the foreign collaborator would supply the information on machinery, equipment, parts. "Lists, drawings and specifications showing types and description of all machinery and "equipment to be used in connection with the manufacture of the said products" together with the list and description of special tools and fixture: Drawings of all jigs, dies and other tools necessary for the manufacture of the said products".
"Drawings of spare parts, sub-assemblies, assemblies of necessary, partial nomenclatures and special manufacture notes, instruction notes for watching and assembling stating the sequences of operation and the time allocated for each to initiate batch manufacture, also tools and templates". If the Indian company gets the specific information on machinery, etc. it has no other way but to have the particular machines, etc. from the foreign collaborators "Will supply with complete equipments, sub-assemblies or parts of their own manufacture as constituent parts corresponding to the contractual products at the earliest possible time compatible with its manufacturing programme".

In order to manufacture, the Indian firm after getting machinery, etc. required raw materials. There also came help from the collaborators. The TNG would provide "full specification of all raw materials used for the manufacture of the said products and process of manufacturing, mixing or treating—such materials as known to and under the control of TNC."

"The Indian entrepreneur thus established a factory. He had the loan of the process knowhow. He procured the machinery and raw materials. In the manufacturing process what he required then was manpower. This necessity made him take help from the collaborator. TNC shall arrange to provide training in the plants and establishments of the foreign country for such employees of the said products by such periods as may be reasonably necessary for the manufacture of the said products by TNC. The training will cover the entire field of designing, production, maintenance, sales and services of the said products including drawing, designing, production planning, selection and treatment of raw materials, machinery processing, assembly, market research and sales promotion".

Training of the employees of the Indian firm took time. In the mean time, TKTC-7 agrees to dispatch a reasonable number of engineers to the company's factory in designing, manufacturing, inspecting and testing products".
The Indian entrepreneur then started production. The next phase involved the advertising of his product. "IC 7 shall use technical and advertising document of "TNC 7 relating to the contractual products and shall submit to "TNC 7 for approval of all technical matter relating to the contractual products intended for advertising and for information purposes, before any circulation is made".

The Indian firm at that point was ready to sell its products. But the mode of selling again did not lie entirely on its own to decide upon. It was specified by the collaboration agreement in which it was embodied that, "IC 7 shall have the right to quote, for and export the said products to the mentioned countries after getting clearance from "TNC 7".

There were other such explicit clauses dictating the movement of products of the Indian firm. This might be (a) in the nature of total ban on exports to all, or some countries (b) limiting the right to export within certain areas and (c) prohibiting the right to export to certain countries.

After a few years the Indian firm might intend to improve its product, to extend the range of its products or to produce a new product. To improve the quality of the product or the product process, research is a necessary element. The foreign collaborator undertook to carry out specific research on behalf of the Indian firm. And it was inserted in the collaboration agreement that, "As a contribution to the actual cost of Research and Development applicable to the improvements and developments of the said products incurred by "TNC 7 in "the foreign country" IC 7 agrees to pay to "TNC 7 at a Bank in that foreign country". Moreover, as the foreign collaborators were the technical assistants of the Indian firms, they time to time communicated to the IC any invention, improvement, or development relating to the scheduled products. "Airing the continuance of the Agreement ... "TNC 7 shall continue to furnish full information in respect of any improvement or development applicable to any of the said products and/or the process and methods (including confidential process and methods) of manufacturing them and/or materials accessories of components thereof made by "TNC 7 eluding patents or inventions or any new design which my be
developed by /"TNC 7 "s alternative for any existing design of the said products* provided that such information shall be furnished by /"TNC 7 cforesaid after the improvement or development has been sufficiently proved to be satisfactory".

These factors were related to the improvement of the existing products. The Indian entrepreneur might also want to extend the range of the product. "If the /"IC 7 shall during the continuance of f the 7 agreement require designs for electric products not within the range of products then being manufactured by /"TNC 7> it shall give notice in writing of such requirements to / TNC 7/ and thereupon provided such requirement relate to / "some product of some range 7 /-TNC 7 will produce designs therefore, md if such requirements relate to other electrical products /"TNC 7 will produce the design therefore or consent to the /IC 7 obtaining design elsewhere".

Furthermore, if the Indian firm intended to manufacture additional products, its responsibilities were also incorporated within the collaboration agreement : "Should f IC 7 contemplate the manufacture of products additional to the scheduled products during the continuance of /"the 7 Agreement the /~IC 7 shall forthwith give notice in writing to the /"TNC 7 of the nature of such products and "if these are of a type already made by /"TNCJ7. /TNC 7 at option may agree to assist or to collaborate with /"IC 7 in the manufacture of such products".

The improvement of, or extension to the range of, or additions to the production, led to the continued flow of knowhow.

We have discussed mainly the technical aspects so far. We now turn our attention to the financial aspects. The Indian firms got financial assistance from foreign government and foreign financial institutions, indirectly and from foreign collaborators, directly* The foreign financial institutions extended to the, "Government of India credits for covering requirements of various equipment needed for power development® This created markets for the products of the cicatrical equipment manufacturing firms.
The Indian Electrical Manufacturers' Association publishes its "Demand Survey of Electrical Equipment" from time to time. According to this publication, the Association specifically studied the annual addition made to the generating capacity in the last few years and found that the 'Demand Survey' was also based on the assumption of timely availability of foreign aids and foreign exchange.

This view could be corroborated by citing the following incident:

'A World Bank team had visited India early in December 1971. While in Bombay, the team had met the representatives of the Association for a discussion on the various aspects of the electrical industry. In the course of the meeting and subsequent correspondences with the World Bank, the representatives of the association impressed upon the team that the electrical products should be brought back under the IDA (International Development Association) list. As a result of this effort, Power Transformers up to 53 KV and switchgear industries have now been added to the list of IDA industries to be entitled to get foreign exchange loan."

Some Indian financial institutions act as agents to provide foreign currency loans to enterprises in India. In this sphere also, there exist linkages with foreign economic powers. We may consider the Industrial Credit and Investment Corporation of India Ltd. as a case in point. It was set up as a financial institution in 1955. The idea to form such type of institution was conceived in 1955. As a first step the International Bank for Reconstruction and Development (World Bank) sent a mission consisting of Mr. George Woods (once President of World Bank) Mr. Robert H. Craft and Mr. Joseph Rucinski to India "to explore the possibilities of establishing a privately owned and operated development corporation to finance the expansion industry..." (Ninth Annual Report of the World Bank). When the mission reported to the World Bank, a steering committee, consisting of three leading Indian industrialists, Sir A. Rimaswamy, L.R. Birla and Mr. A.D. Shroff was set up to "discuss with the World Bank the constitution and structure of the new financial institution": The first Board of Directors of ICICI consisted of..."
of three foreigners. Mr. P. S. Beale, Chief Cashier of the Bank of England was appointed the first General Manager of ICICI in January 1955. In February 1955 the share capital of Rs. 5 crores was offered to the public. Of these 30 per cent was offered to foreign (then British and U.S.) investors. Among the subscribers to the share capital, there were several foreign financial sources, like the Chartered Bank of India, Australia and China: Commonwealth Development Finance Company Ltd.; Sun Life Assurance Company of Canada in the U.K.; Mr. John D. Rockefeller III, Olin Mathieson Chemical Corporation. Rockefeller Brothers Fund Incorporated and Mr. House Electric International in the USA. Che of 15:

The objectives of the ICICI is to provide loans in foreign currencies for payment for imported capital equipment and technical services. In this respect it gets foreign currencies from the World Bank, the Development Loan Fund (now merged with the Agency for International Development) Kreditanstalt fur Wiederaufbau (an agency of the Government of Federal Republic of Germany) and the Government of U.K. ICICI’s relations with the World Bank and the International Finance Corporation extend beyond the financing of individual projects, for example, ICICI sends its staff members for training to the World Bank and now to the IFC. Upto 1964 the electrical equipment industries received 8.8 p.c. of the total loan sanctioned by the ICICI.

Financial assistance from foreign collaborators is conducted in a more direct way. The Indian firms generally formed joint ventures with the suppliers of technology, the transnational corporations, the latter taking a share of the capital.

After discussing the nature of the linkage established through a joint venture, we will now analyze the other two forms of linkage, namely, acquisition of already existing Indian firms and opening up of Indian subsidiaries.

In this respect we will simply cite two cases of each of the forms: first the acquisition of an existing Indian firm producing electric power equipment, by a transnational corporation in the power industry, and secondly, the opening up of an Indian subsidiary of a transnational corporation in the power industry.
Linkage Through Acquisition

In the first case the Indian firm was established as an engineering firm in 1942 by an Indian entrepreneur. The promoter entrepreneur was technically well qualified, with such degrees as A.M.I.E. (U.S.A.; Mem. Am. S.M.E. (USA).

The initial licence was secured for the establishment of two companies for the manufacture of ACSR Conductors copper and Aluminium conductors and wires of all categories. Substantial and valuable orders and contracts were received from the Central and the State governments. Regular production of transformers was started from 1955. The unit set up for the manufacture of transformers and switchgear at Kolkata Bengal was probably the largest transformer works in India at that time. The unit had one of the most modern design and drawing offices and it manufactured transformers with its own designs. It has excellent designing, manufacturing and testing facilities. In view of the excellent production facilities, the quality was remarkably good and the demand for the company's products was very high. The factory for the manufacture of electric motors, generators and allied machinery was one of the largest motor works in India. A large design and drawing office was established for this works, and motors were manufactured with their own design. Their products and services were valued for "their high quality and there was even an increasing demand resulting in repeat orders-from the Central and practically every State government. A large number of electric motor designs and prototypes were developed, tested, finalised, and put into production during 1956-57. Electric motors manufactured by the firm was the first recipient of the Indian Standard Institution (ISI)’s quality mark. At the unit in West Bengal, Switchgear designs and development division was established and substantial progress was made in switchgear designs and prototype. The Oil Circuit Breakers designed and manufactured by the firm were the first in India, which have been tested and approved by the International testing Authority, Holland. The firm received the industrial licences for establishing a new industrial undertaking for the manufacture of transformers of all types. The unit commenced production during 1959-60 and trained its workmen, manufactured and delivered over 100 transformers with their own design.
1963, the firm came to be linked with a large transnational corporation. The reason behind this could not be found in any document of the firm.

The transnational corporation (TNC) changed the structure of the firm, the indigenous technological and capital base of the firm, and brought it into its control. The TNC acquired more than 50% of the equity voting power in the firm. The name of the firm had been changed in order to incorporate the name of the TNC. The firm started to act as a selling agent not only of the TNC but also of the foreign associates of the TNC of the various types of the heavy electrical and mechanical equipment. For example, the firm negotiated for the TNC's associates of the same country of origin regarding a large order from a State Electricity Board for the supply of two turbo sets and high and low tension switchgear and ancillary equipments.

The indigenous design of electric motor was changed and it was declared in the annual report of the firm in 1964-65 that by the aid of the year, the major portion of the motor production would be according to the TNC's design. Moreover, the firm concentrated on the expansion of sophisticated product lines and started the manufacture of the high tension air blast circuit breakers with the latest design from the TNC. The same was the case in manufacturing high voltage isolating switches.

The additional funds required to finance the increased manufacturing activities of the firm were partly met out of credit facilities extended by the TNC on "their supplies of materials."

Ir.kage Through Subsidiary

In the second case the firm was incorporated in India in 1957 as a subsidiary of a foreign firm. The parent firm was a large transnational corporation in power equipment industry.

In the Board of Directors the Chairman was an Indian* but the four managing directors were representatives of the TNC. The firm's main activity has been the manufacture of the product under licence from the parent firm.
For this purpose the TNC exported to the fire, the subsidiary in India, drawings and other particulars of design details of the manufacturing process, specification of raw materials and components, and their treatment. For setting up the plant, TNC furnished the list of equipments, specification for services needed for the plant and the general layout of the factory buildings and other plant services. TNC assisted the firm in the selection of equipment erection and trial runs of the machine, and planning and organisation of the production. TNC deputed qualified technical personnel to the firm and trained the firm's engineers at its plant. The firm imported machine tools, jigs, tools, fixture and instruments developed by TNC for machining, assembling and testing. TNC assisted the firm in the selection of this equipment.

Initially the TNC held 47% of the equity share of the firm. When the additional capital was required to finance the expansion of manufacturing activities of the firm, the entire foreign exchange requirement for the first stage of the proposed expansion of the manufacturing activities was met by the TNC, firstly, by increasing their participation in the share capital to 51% of the increased paid up share capital, and secondly, in the shape of loan for the balance.

In a memorandum of 1965 from the General Manager of 2CIC, it was mentioned that, internationally well known name and trade marks of the TNC would assist the firm in marketing its product.

We have so far discussed the nature of different forms of linkages established between the transnational corporations and the manufacturing sector of the power equipment in India.

This linkage is determined by several factors. The Government of India imposed import restriction policy to provide opportunity to Indian entrepreneur to manufacture the power equipments. These equipments were to be made to cater to the needs of the power plants. Power plants were designed by the transnational corporations according to their standards.
To acquire that experience, investment in research was needed. Investment in research and application of the result into production had a long gestation period. Indian private entrepreneurs hankered after quick profits. The 'easiest' way before then was to get quick profits was to establish linkages with the transnational corporation. With the transnational corporations, Indian entrepreneurs had previous linkages as exporters, and importers, respectively. They together wanted to share the market with the same technology and trade marks. Strong xenophilic attitude of the Indian market also provided the incentive. Import of technology needed foreign exchange. Foreign financial sources and the transnational corporation extended foreign exchange loans. Foreign financial sources acted in favour of linkages of transnational corporations.

...Hence, mere change of economic activity from trade to manufacture did not wipe out the circle of linkages. It just broke the previous circle and supplemented it with the formation of a new circle.

**Linkages of TNCs with The Power Equipment Manufacturing Sector In India's Biblic ENTERPRISE**

It is generally presumed that there are certain differences between the nature of operation of an enterprise in the private sector and that of an enterprise in the public sector of a country. One of the major differences is considered to be the fact that earning quick profits forms a primary goal of a private sector enterprise whereas a public sector enterprise does not consider this as a major guideline.

We have examined in the last section that the consideration of quick profits by the electrical power equipment firms played an important role in the establishment of linkages with the transnational corporations. Though not guided by the same consideration, the public sector enterprises also acted in the same way to come in contact with the transnational corporations, in some cases with the same TNCs.
A document has recorded the fact that the decision to establish a
factory for the manufacture of heavy electrical equipment by the Government
of India, 'was sequel to number of forces set in motion during the receding
decade, calculated to take the country toward self-sufficiency in basic
industries, including heavy electrical equipment required for the power
development programmes'. Rinsiant to the findings of the Advisory Planning
Board (Dec. 1946) and the recommendations of a Technical Committee on IIengineering
Industries of the Industrial Conference held in December 1947 the Government
of India appointed a Committee early in 1948, headed by the then Director
General of Industries and supplies, to explore the possibility of developing
the manufacture of heavy electrical Power Plant to meet the requirements
of the generation, transmission and distribution of power in the country.
The Committee emphasized the urgency of establishing such a factory and
noted that, "No country which wishes to develop its industrial potential can
afford to be wholly dependent on other countries for supplying its requirements
of basic electrical power plant. India's large plans for the development of
hydro-electrical and river-valley projects depend entirely on foreign countries
for their basic plant. This is lamentable position to be in, as it puts the
power supply industry in jeopardy in time of war".

This view was supported by an inter-Ministry meeting held on August 26,
1954, where the conclusion that was arrived at was: "

'No country which wished to develop its industrial
potential could afford to be wholly dependent on
other countries for supplying its requirements of
basic power plants'.

The motive was a reflection of the effort to achieve economic
independence, but the way to translate the motive into practice did not
reflect the same.
In the report of the same exploratory Committee it was suggested that the government should establish the factory in collaboration with foreign manufacturers of 'world repute'. The Minister of Production, on the issue of establishing heavy electrical equipment factory, raised in the Lok Sabha on June 18, 1952, said that, 'For a factory to manufacture these, wo need of course help and assistance from abroad, from the progressive countries of the west like America'. The Ministry of Production then convened a meeting of the representatives of the banning Commission and the Ministries of Commerce and Industry (Development Wing) and Finance etc on January 2, 1953. The meeting decided that the first step would be to approach foreign firms of 'international repute' to ascertain if any of them would be interested to provide technical and financial participation necessary for the establishment of the factory. At another inter-ministry meeting held on April 4, 1953 it was argued that technical advice from experts of world wide repute would be essential for deciding the capacity and location of the factory and the precise sectors of the demand which the factory should aim at supplying.

As the project, built with the collaboration of foreign firms needed a considerable amount of foreign exchange, the consensus of the opinion of the inter-Ministry meeting was that technical advice from foreign firms should be made acceptable only on the explicit condition that it would be followed by financial participation in the schemes by the firms concerned. But a Committee constituted by the Ministry of Production in October 1954 raised an objection that, financial collaboration should not be made a necessary condition for the selection of consultants. Such a condition would unduly restrict the field of choice of prospective consultants. The Ministry of Production accordingly recommend in Aferch 1955 to the Government that, sane qualified firms of leading electrical manufacturers of international repute should be invited to discuss the scheme and to indicate the basis of their technical, and if possible financial collaboration and thereafter one firm should be selected to prepare a detailed scheme for the project. The project report should be called for on the basis that while financial participation
by the technical consultants would not be a necessary condition. schemes offering such participation would be given special consideration.

The Minister of Production thereupon invited firms of international repute to submit project reports on the understanding that the firms should themselves propose a manufacturing programme which in their opinion would constitute an economic proposition.

Three important points are to be noted in this context. First, the programme of construction of a power equipment factory was undertaken to supply equipment to power plant(s) designed by the foreign consultants according to the standard of "their home country. Thus, the equipment to be manufactured in the factory also followed the design of the developed countries. Hence there was need for a firm of loading electrical manufacturers of world repute to be appointed as a consultant to the proposed factory.

Secondly, though it was observed that consideration of tying technical collaboration with financial collaboration would unduly restrict the choice of foreign consultants, it was decided that scheme offering financial participation would be given special consideration.

Thirdly, it was decided that not the Government but the foreign consultants would themselves propose the manufacturing programme.

The field was thus prepared to establish linkages between the public sector enterprise in the manufacture of power equipment and the transnational corporations.

We will discuss the linkage with only one transnational corporation in the early phase of the project as a case in point.
On November 17, 1955, an agreement was signed between the Government of India and the Associated Electrical Industries Ltd. (AEI) of United Kingdom, a well known transnational corporation in the electric power equipment industry, for the proposed heavy electrical equipment factory in the public sector.

AEI was selected as consultants to the Heavy Electricals (India) Ltd., the public sector enterprise in the manufacture of power equipment. The consideration which guided the Ministry of Production in its choice of "the AEI were several. In a note in September 1955, submitted to the Cabinet Committee, the the Ministry of Production mentioned the most important reason as that, ASI was willing to go in for financial participation. Another reason was the AEI's link with atomic research. He AEI was among the leading groups of firms elected by the UK atomic energy authority for developing atomic power stations. Dr. Bhaba, Director of Development of Atomic Energy in India, had stated that other things being equal, the AEI should get preference because of this factor. This was an important consideration and the AEI had also offered its cooperation in developing atomic energy power stations in India.

In the agreement, the functions to be performed by the AEI were:

i) preparation of detailed project report.

ii) preparation of plans and specification of the plant, machines, equipment and materials.

iii) examination and scrutiny of the tenders received.

iv) indication of delivery requirements of plant and machinery. 

v) supply of floor plans and general floor specifications.

vi) supervision of the construction of the factory.

vii) rendering technical advice in the operation.

viii) preparation of a suitable training scheme.

The features of a 'chain-effect' of the linkages with the transnational corporations were also present in this case. First, AEI acted as the purchasing agent of HEI, and most of the equipment was imported, from AEI's factory in
the U.K. Secondly, arrangements were made for obtaining technical assistance from the transnational corporations of the same country of origin. Thus subsidiary agreements were entered into with the English Electric Co., UK, and the British Insulated Cailendars Cables Ltd., UK for the manufacture of hydraulic turbines and capacitors respectively. Thirdly, sterling loans were received from AEI, and British Insulated Cables... Forttfrly, services of foreign technical specialists for assistance and guidance in the various fields of the manufacturing and design activities were supplied under the Colombo Plan.

The most important aspect of the collaboration between AEI and HE(1)L was the making of a situation of continued collaboration, as revealed by two reports of the committees appointed by the Government of India. One was the 19th Report of the Committee on Public Undertaking of the Fifth Lok Sabha, and the other was the 89th Report of the Committee on Public Undertakings of the Fifth Lok Sabha.

To the first Committee it was stated by a representative of HE(1)L that, 'in the case of hydro turbines, it is not as if one machine can be just used exactly in another location. So, each machine for each location has got to be designed. In spite of the fact that we got specifications and drawings for 30 machines, we had to seek the assistance of the consultants for either modification or for redesigning of five schemes'.

The Committee was of the opinion that 'there was no specific provision in the Project Report for activising self-reliance by developing indigenous substitution for imported raw materials and components. The performance of the Company towards import substitution had been rather disappointing'. The Committee was informed by a representative of the enterprise that, 'achievements of cent percent indigenous content is not a practical proposition'.
To the second Committee the representatives of the public enterprise on electric power equipment stated that, 'duration of an agreement should be with due consideration for the gestation period of the product and the time acquired for the absorption of technology, and thus there should be provision for extension of duration of agreements'. And moreover 'there should not be any hard and fast rule regarding the period of a licence agreement'. Regarding the adaptation and development of technology they were of the opinion that 'one time purchase of technology may not be feasible till such time we are able to develop our R & D facilities at least to the minimum international standard; and at the same time they informed that their R & D expenditure in 1974-75 was of the order of 0.34% of their turn over. Hence, they came to the conclusion that 'capability in developing new products is yet to be fully established and we have to go a long way in developing capability in developing basic knowhow' and naturally have to go with transnational corporation, as 'they opined that, 'limited collaboration for consultancy services is unavoidable'. So, the linkages with transnational corporations has continued.

In the case of the public sector enterprise, the circle of linkages was, in essence, the same as that of the case of the private sector enterprises. Only one or two elements varied.

Conclusion

It follows from the above discussion that the mere change of the economic activities, from trade to manufacture, in the private sector or from manufacture in the private sector to manufacture in the public sector does not signify the end of linkages between transnational corporations and a third world country. In essence, it remains the game, though the nature may change.
If the path of industrialisation and modernisation of the developed countries is followed by the third world countries, there is no other way but to establish linkages with transnational corporations. If the target to be achieved and the way to attain the target are determined on the basis of their own resources of technology and capital, the third world countries may out of the orbit of the operation of transnational corporations.
