# Research Report Series No. 102

Factors Influencing Migration to Urban Areas in Pakistan - A Case Study of Peshawar City -

Prepared by
Board of Economic Enquiry
North West Frontier Province
University of Peshawar

Pakistan Institute of Development Economic Post Box No. 1091, Islamabad

#### FOREWORD

This report on factors affecting migration to

Peshawar City is the second in the series of such case

studies being done under the auspices of the Pakistan

Institute of Development Economics. The first report

provides a similar analysis in respect of Gujranwala City.

These studies are based on a sample survey of each

selected city. The survey of each city is supplemented

by a survey of infrastructure of its adjacent rural areas.

It is hoped that the contents of this report and other similar reports would be useful to the policy makers and planners in understanding the role of various social and economic factors which influence people to leave their place of original residence in order to live in cities.

The survey and the writing of the present report were done by the North West Frontier Province Board of Economic Enquiry, Peshawar.

The Pakistan Institute of Development Economics appreciates the effort made by the staff of Board of Economic Enquiry, for this undertaking, particularly those of its Director Dr. Nurul-Islam Mian who invested a great deal of his time for getting the report re-written in the light of the comments and suggestions given by the PIDE research staff. Mr. Mohammad Ahmed Khan, Research Economist at the Board of Economic Enquiry was primarily responsible for the preparation of this report.

## Chapter I

#### INTRODUCTION

The rapid concentration of Population in large cities during the recent decades has been a striking feature of the urbanization process in Pakistan. The growth of Population in cities is to a large extent contributed by in-migration either from rural areas or from other urban areas. In view of the fact that the rate of natural increase of population is already very high, the additional growths due to migration have been causing disproportionate increases in the growth rate of urban population in comparison to the absorption capacity of industrial units, trade and other urban social services. Internal migration has not only been considered as a major contributing factor to the urban unemployment and under-employment but also as a drain of valuable human capital from the rural areas.

In view of the important role of migration in the social and economic development process, an understanding of the factors affecting internal migration to urban areas is considered important for the formulation of appropriate policies regarding population redistribution within the country.

#### Objective |

The present study was assigned to the Board of Economic Enquiry, N.W.F.P., by the Pakistan Institute of Development Economics as a part of a series of such studies entitled "Factors Affecting Urbanisation in Pakistan". Its main focus is on the extent, nature, and causes of in-migration to the areas in the

jurisdiction of the Peshawar Municipality (henceforth interchangeably called the City, the Pashawar city, Pashawar), Pashawar, though the biggest and the most congested urban centre in NWFP. has been growing at a declining rate. Therefore, the study's scope was extended also to include out-migration from the city. The time reference of the study is the period commencing after the 1961 census and ending in July 1974. In pursuing the main objective of the study, i.e., to identify the factors which influence people to migrate to Peshawar city, an attempt was made to collect relevant data on in-migrants in respect of the following:

- a) Places of original residence b) Causes of migration

  - c) Characteristics of migrants

In addition, the following information in respect of outmigrants was also collected.

- a) Causes of out-migration.
- b) Destination of out-migrants.
- c) Characteristics of out-migrants.

# Methedology

The study is based on a sample survey of migrants in Peshawar city supplemented by a survey of selected villages with regard to their infrastructure.

In order to draw the sample for the Peshawar city survey lists of property units maintained by the Excise and Taxation Department were used as the sampling frame. This department has divided the city into 16 wards, which were grouped into five sectors for the purpose of the survey. The grouping was done in consultation with the Taxation Department according to homogeneity and contiguity of the wards.

The sample of 2438 property units, forming 5 percent of the total of 49,766 property units in the city, was allocated to each sector in proportion to its size. The allocated sample was drawn using the random number tables.

Table I

TOTAL PROPERTY UNITS IN PESHAWAR CITY
AND NUMBER OF UNITS SELECTED FOR SURVEY

S.N.	Sector Number	Total property		Sample Units
-		Units	Number	Percent of Total
1.	I	10,673	533	5.00
2.	II	12,063	603	5.00
3.	III	9,433	472	5.00
4.	IV	5,000	-250	5-00
5.	V	12,592	630	5.00
6.	All Sectors	49.766	2403	5.00

The Excise and Taxation Department does not maintain separate lists of residential and non-residential units. Therefore, in the sample got included the non-residential units as well. These constituted 32,23 per cent of the sample as shown in table 2.

Table-2
CLASSIFICATION OF SAMPLE UNITS BY RESIDENTIAL AND NON, RESIDENTIAL UNITS.

S.No.	Type of property units	No.	Percent	
i. 2. 3.	All types Residential Non-residential	2488 1686 802	100.00 67.77 32.23	

The non-residential units comprised of commercial/insdustrial units (shops, garrages, factories etc;), open plots, mosques, and dilapidated houses. The assumption is that their share in total property units would be the same as in the sample. Thus, the representation of residential units is not affected by their inclusion of non-residential one in the sample.

All but 18 of the 1636 residential sample units were contacted and response was achieved from their occupants.

Table-3

TOTAL AND THE ACHIEVED SAMPLE OF RESIDENTIAL UNITS

S.No.	Particulars	Number	Percent
1.	Total sample residential	1636	100.00
2.	Units contacted	1668	98.93
3.	Units not contacted	18	1.07
		`	

Of the 18 units under reference 17 were vacant. And one was locked. Its occupant was not expected back for some months

In order to secure an understanding of the "push" factors operating in rural areas, a sample was drawn of 30 villages representing approximately 5 percent of the total villages in the Peshawar District. Village list was taken from the District Census (1961) report. The villages in the different Tehsils of the district were given a continuous serial number, and selection

was randomised from the district as a whole and not the different TehsilS taken separately. Table 4 below shows the total sample and its distribution over the different Tehsils.

Table 4

TOTAL AND SAMPLE VILLAGES IN PESHAWAR
DISTRICT

3.Mo.	Locality	Number	of Villages.
		Total	Sample
1.	Peshawar Tehsil	252	15
2.	Charsadda "	197	7
3.	Nowshera "	139	8
4.	Total = Pashawar Dis	trict 588	30

(list of sample villages given in appendix-I)

The "Baiy Chiragh" un-inhabited villages are not included in the total given in the above table.

Questionnaires in Peshawar city were filled up by the Board's staff who paid door to door visits. The questionnaire was in the urdu language (its english version forms Appendix-II). The interviewers were issued written instructions, in urdu. The questionnaire (No. 2) used for collection of data about the sample villages forms part of the Appendix-II. The questionnaires were filled up by the survey staff with the help of 'Patwaris', school teachers, and other persons in the sample villages.

## Conceptual Clarifications

# i-In-Migrants

For the purpose of this study an in-migrant was the person who satisfied the following conditions:-

- a. Had moved into Peshawar after the 1961 census but before Ist August, 1974.
- b. Had been in Peshawar for at least one year ending July 31, 1974;
- c. Had been in the City for less than one year upto July 31, 1974 but his total stay was expected to be of at least one year's duration.

# ii. Out-Migrants

Persons satisfying the following conditions were taken as out-migrants:-

- a. Left the City before Ist August, 1974, and had been away for one year or more.
- b. Had been away for less than one year but intended to stay out for total period of one or more than one year.

# iii. Local Population

The term local population has been used for the people living in Peshawar since before the 1961 census.

#### MIGRANTS AND THEIR PLACE OF PREVIOUS RESIDENCE

The total number of persons living in 1668 housing units which could be contacted out of the sample was 12,593. Out of these 1,227 persons were either themselves migrants (after 1961) or the children born to them subsequently. The rest consisted of those who were born in Peshawar, those who migrated before 1961 and their respective children. The break up of all the persons in the contacted housing units by migratory status is provided in Table 5.

### Number of Households:

The total number of households residing in 1668 housing units was 2260. Of these 1978 had been in Peshawar prior to 1961 census and the remaining 282 came after 1961 census but before July 31, 1974. These 282 households were treated as migrants households in this study and analysis in respect of such households would be provided mostly, in terms of the number of household heads.

Table 6 provides the distribution of household-heads by years of in-migration to Peshawar. The table indicates an increasing trend of in-migrants over the years, particularly since 1970. Out of all the migrants who moved to Peshawar city over the years 1971-74, the proportion coming since 1970 was about 44 percent. One possible reason for this rise could be the reestablishment of Peshawar as provincial capital after the dissolution of the one Unit.

Table-5
SAMPLE POPULATION BY MIGRANT STATUS

$S_{\mathbf{r}}$	Migratory Status	T,	lumber		Pe	rcent	
Mo.		Male	Female	Both Sexes	Male	Female	Both Sexes

	Total	232	100.00

# Expected duration of Stay

The survey also collected information on the years of expected stay from the migrant household heads. This information is portrayed in table 7.

About 38 percent of household heads stated that they intended to live in Reshawar for ever (Table 7). Another 39 percent had not yet made a decision in this respect. Also about 10 percent of the household head who did not respond can be placed in this category (of the 'undecided ones).

A little over 10 percent/respondents, being on transferable jobs, could not specify the period of their expected stay. Only about 3 percent specified the period. Most of them stated it to be over 10 years.

Of the in-migrants classified in Table 7 by their expected stay in Pesha ar, those in serial numbers 1 and 6 forming 43.02 percent of the total, can be treated as permanent in-migrants. Categories number 2 to 4, froming 2.87 percent of the total, belong to semi-permanent class. And the rest, 49.11 percent are cases of temporary in-migration.

As gathered from interviews with the in-migrants and also the local population, Peshawar constantly experiences population inflows and outflows. The city serves as a temporary halting station to a large number of in-migrants on their way to other urban centres, mostly outside the Province. The outgone are replaced by the next streams of in-comers. Fortunately for the city, the rate of such replacement is on the decline.

Table-7 EXPECTED STAY OF IN-MIGRANT HOUSEHOLD HEADS IN PESHAWAR CITY

S.Mo.	Period of expected Stay	Number	Percent
1	For ever	105	37.63
$\tilde{2}$ .	More than 10 years	4	1.43
$\bar{3}$ .	5 to 10 years	$\vec{2}$	0.72

5.	Undecided	110	39.43
5.	Not known; post transferable	29	10.39
7.	No idea	13	6.45
в.	Not reported	9	3.23
9.	Total	279	100,00

# Place of Previous Residence

In migrants to Peshawar come mainly from within, the NWFP and the adjoining tribal areas. As will be seen from Table 8, 75.58 percent of the in-migrants had been living in other parts of MWFP and 11.55 percent in the adjoining tribal areas before shifting to Peshawer city.

Among all the districts in Pakistan, Peshawar district has been the principal source of in-migration accounting for 47.11 per cent of all in-migrants. The other important areas are the districts of Mardan and Kohat showing corresponding figures of 9.02 percent and 5.97 percent respectively. districts of Swat, Dir and Chitral, covered by the Malakand Division, accounted for 8.11 percent.

#### CHARACTERISTICS OF MIGRANTS

#### Household Size

The average household size of the migrants to Peshawar city was 4.3. Compared to this the corresponding average for the non-migrants was 5.4. The lower average for the migrants is due to the large proportion of simple member households among the migrants. A comparative picture of the distribution of migrant and non-migrant households by the number of persons in the household is provided in Table 9. The table shows that the percentage of one person households is 33 among migrants and 6 among non-migrants. On the other hand the households with 5 or more persons were about 38 percent among the migrants and 64 percent among the non-migrants. These results are supportive of the general hypothesis that the migrants first move to the city alone and their dependents or families come afterwards.

# Age-Sex Distribution

Table 10 gives age distribution of all in-migrants and the household heads separately. The single largest concentration of in-migrant household heads is seen in the age-group 25-29 accounting for 15.67 percent. The next higher group, follows with 15.25 percent.

The younger groups are relatively more heavily represented in the in-migrant population than the middle and older ones. Thus, as will be seen from Table 10, household heads aged up to 34 accounted for 46.51 percent of the total. Those in age group 35-49 accounted for 31.91 percent. The next higher one, 50-59, claimed 11.71 percent. Persons above age 60 made up the balance of 9.57 percent.

pespite a relatively larger proportion of one-person households among the migrants their sex ratio did not indicate a relatively higher proportion of males as compared to non-migrants. This is clearly indicated by the corresponding sex ratios of migrants and non-migrants, which came out to be 109 and 113 respectively.

### Marital Status

The proportion of un-married among the migrants was lower than among those who were non-migrants, being 54 percent and 60 percent for the two groups respectively. Table 11 indicates that among the female migrants the proportion married was higher than the corresponding proportion among the female non-migrants. This is indicative of marriage migration of females to Peshawar city.

Among the household heads (almost all males), the percentage of un-married was only 21 which indicates that most of the migrants are married whether they come alone to Peshawar or they come with dependents.

#### Literacy

The literacy status of migrants and non-migrants in Peshawar city is described in Table 12. The table shows that of those aged 5 and above in the sample population, whether migrants or non-migrants, 55 percent were literates. The literacy percentage was however, much higher for males (05%) than for females (44%).

PEASONS STILL AT SCHOOL)

A comparison of literacy of migrants and non-migrants shows that 68 percent of non-migrant males were literates as compared to 44 percent among the migrants. The literacy percentage for females was much lower (17 %) for migrants than for non-migrants (47%). These differences can be taken to represent the rural - urban differentials in literacy by sex.

### Level of Education

The distribution of literates among the migrants and nonmigrants by level of education attained is provided in Table 13.

The table shows that out of literate migrants, 36 percent were
educated to below middle level, while for the non-migrant
literates the corresponding percentage was 40. This shows that
the percentage of migrant literates who had completed middle
or above level of education, was relatively higher than the
corresponding percentage among the non-migrants. This indicates
that a large proportion of migrants came to Peshawar for jobs
requiring educated persons or they came for educational pursuits,

### Working Status of Population Aged 10 and over.

Table 14 and 15 classify the total in-migrants and house-hold heads respectively according to their working status before and after moving into Peshawar. The relevant summary statistics are given below:-

looking for work	199.00	100.00	100.00	100.00

The catagory 'neither working nor looking for work' is comprised of housewives students, idle persons aged 60 and over, pensioners, and invalids. Of the 282 household heads 32 belonged to this category before they moved into Peshawar. The number fell to 15 afterwards because 24 persons who were previously students, joined the work force after coming into Peshawar, while of the previously employed ones went into retirement. Thus, the working population gained 17 new entrants to working groups in Peshawar.

The category 'neither working nor looking for work' includes 3 housewives and 3 students in post-migration period. This may be clarified. They were in Peshawar for reasons other than economic. They had been maintaining independent households and were by virtue of their actual and intended stay in Peshawar,

aligible for inclusion in the in-migration category.

Returning to Table 14 and 15 it would be seen that activity rate of in-migrants in general as well as that of house-hold heads improved after migration. It rose from 43.72 percent to 45.02 percent in the case of all in-migrants, and from 38.65 percent to 94.63 percent in the case of household heads.

Female participation in economic activity was negligible both before and after migration. Taking all in-migrating females as a whole, only 1.91 per cent were economically active before and 1.39 percent after moving into Peshawar. The corresponding figures for males are 79.39 percent and 80.30 percent respectively.

### Employment Level

Beside a rise in activity rate, the level of employment of the in-migrants improved too. From table 16, we find that of the economically active household heads, 86.40 percent were employed before and 98.87 percent after coming to Peshawar. The unemployment rate fell from 13.60 percent to 1.13 percent. In the case of the in-migrant (active) population as a whole, the unemployment rate dropped from 16.67 percent to 4.94 percent after migration.

The employed ones as suggested by their income data, appeared to be more fully employed in Peshawar than previously. This is especially true of those coming from rural areas.

#### Income.

The sample population's response to the question on income was most unsatisfactory. It is believed that they grossly understated their existing income. As regards their previous income, a large number of them—either did not remember it or could not specify it in terms of money. Those who did state it, are believed to have erred on the high side. This applies particularly to those from rural areas. Not withstanding these flaws the data on their present and previous

								! !		

income point to significant improvement in their income level after moving into Peshawar.

Prior to coming to Peshawar, 20 or 11.24 percent out of the 176 household heads who provided information on income, earned less than Rs. 50 a month. In the corresponding column for the post migration period i.e. after coming to Peshawar, there are, as will be seen from table 17, only two households heads forming 0.77 percent of the total. And we do not believe that these two household heads stated the fact when they said that they were earning less than Rs. 50 per month. A summarised versions of table 16 is given below for a comparative study of previous and present income of the household head.

Monthly Income.	Percent of Household	Heads
	In Peshawar	Previous
Upto Rs. 100	14.55	45.26
101-200	45.51	26.32
201-300	19.31	13.69
301-400	7.94	2.63
401-50	2.33	3.68
501 and above	10.31	8.42
All Levels	100.00	100.00

Due to inflation, the extent of improvement in economic well being of the population under study would not be as great as indicated by their comparative money income data given above.

Allowing for the suspected under-reporting of income for post-mig-ration period, there are, however, strong suggestions that the

real income of the migrants did improve significantly after migration, despite inflation.

### Remittances to and From Home:

Of the 279 primary movers, 53 or 19 percent had been sending money home after coming to Peshawar. Most of them (27), had been sending less than one hundered rupees a month. (table 18)

Table 18

DISTRIBUTION OF HOUSEHOLD HEADS BY MONEY SENT TO AND RECEIVED FROM ( ) HOME AFTER COMING TO PESHAWAR.

ð.	Not reported	3.0	3,58	7	2.51
	Total	279	100.00	279	100.00

Only 22 or 7.89 percent of household heads concerned had been receiving money from home after moving into Peshawar.

The majority of them, 12, received less than one hundered rupees a month. These and other recipients of money from home comprised mainly the persons who were un-employed and also these who were

not available for undertaking employment. This latter class includes students and others who came to Peshawar for reasons other than economic.

### Occupations

Significant change in occupational composition of in-migrants took place due to migration. Prior to migration, the occupational group appearing in Table 19 under the head "Agriculture Animal Busbandary...." had the single largest concentration, 32.87 percent, of the workers (the employed household heads). This group's share fell to 2.65 percent after in-migration and the category of workers classified at no. 7 in table 19 as "Production and Related workers...." energed as the single largest one with 31.82 percent of the workers.

Suming up, the Agriculture, Animal husbandry ....."
group was the major losing group due to migration. The major
gaining categories were (i) professional and technical workers,
(ii) sales workers, (iii) service workers, and (iv) production
workers.

# Type of Housing

In Peshawar, 61.29 percent of the in-migrants lived in 'pucca' and 10.04 percent in semi-pucca houses. Before coming to Peshawar, only 22.58 percent of them lived in pucca and 23.30 percent in semi-pucca houses. (Table 20) It would, however, be misleading to construe from these statistics that they had been enjoying better living condition in Peshawar than previously. As seen during the course of the survey, most of the houses were

very samll, in bad repair, not provided with proper amenities, and had highly insanitary surroundings. For the in-migrants from rural areas at least, the change in this respect did not appear to be for the better. In the villages, the houses are at least more spacious, if not better built, and placed in less incongenial surrondings than those in Peshawar.

### Tenure Status

Most of the in-migrants (59.50 percent) lived in rented houses in Peshawar. (Table 20) A little over 20 percent of them owned the houses in which they were living in Peshawar, while about 14 percent lived in houses which were nei-ther owned nor rented in by them. This latter category includes those who were living with their relatives, friends, or/and in rent-free houses provided by employers.

Of the houses in which the migrants lived before migration 46.59 percent were rented. The category of neither rented nor owned accounted for 18.28 percent, while the ownership status of 7.17 percent was not reported.

#### FACTORS RESPONSIBLE FOR IN-MIGRATION TO PESHAWAR

tc

In causing the population under study/leave their previous abodes and migrate to Peshawar, the push/factors played the dominant role and in the selection of Peshawar / its nearness to migrants previous places of residence and also their better knowledge of opportunities in the City due to presence of friends and relatives in it, were the major determining factors.

# Reason for Leaving previous Place of Residence

The response of the household heads to this question is given in Table 21 under seventeen different heads which can be sifted into three broad groups viz; (i) economic reasons and (ii) non-economic reasons and (iii) combination of the aforestated two factors. Each of these groups admits further classification into (i) push factors, (ii) pull factors and (iii) non-discretionary migration; this latter category is introduced to cover the cases of transfer in service and marriage migrations. Among the reasons for leaving their previous abodes, economic factors were mentioned by 69.53 percent in-migrants. About 7 percent gave non-economic reasons, and the remaining 23.66 percent stated that they had left their previous abodes because of a combination of economic and non-economic factors (Table 21).

# Economic Factors

Among the 134 respondents who attributed their migration to economic factors exclusively, 95 pr 23.68 percent stated that they left their previous place of residence because their income was insufficient. Another 15 or 5.32 percent left because there were

no job opportunities for them after they had completed their education. Insufficiency of land was mentioned by 2.83 percent and absence of non-agricultureal jobs by 5.32 percent respondents. One person left as he had suffered loss in business. In all for 69 percent the factors of migration were attributable to economic reasons.

Only 24 or 3.51 percent respondents stated that they left their previous places for better income prospects outside.

Migration due to transfers, retirement, and to join other migrants in the city (in cases of secondary movers) was reported in 35 cases. These formed 12.42 percent of total in-migrating households. They belong to non-discretary migration category.

The push forces as suggested by the above given data, to played the dominant role in causing the respondents/migrate. Further support to this suggestion is provided by the data on pre and post migration income level of in-migrants as given in Table 21.

The ranking of the different non-economic factors of migration, as above, is more or less in line with the common knowledge on the subject. Lack of good educational facilities, and incongenial living conditions in rural areas are too well known to need a comment here. These serve as strong push factors culminating in migration if the affected ones have means to break away from rural life.

\* \*

Mal-adjustment with rural environment is another equally important push factor. The five cases falling in this category are of the in-migrant household heads who were forced to leave their villages due to enmity.

#### Reasons for Coming to Peshavar.

In order to identify the pull factors and also to serve as a check question, the in-migrating household heads were asked to specify the reasons for coming to Peshawar. The response patt= ern was quite consistent with their statement of push factors discussed in the previous section (table 22). In Peshawar, they either found a solution to the problems faced by them in their previous abodes or hoped to find one. The respondents mentioned 17 different reasons for coming to Peshawar. Here the in-migrants were more clear and specific than in their response to the quistion as to reasons for leaving their previous abodes. In the latter case, 193 of them specified economic reasons, 21 gave no economic reasons, while 69 stated a combination of these two. other hand in response to the former question (why they came to Peshawar), economic reasons were stated by 231, non-economic by 15, and a combination of these two by 35. This statement of

reasons can be accepted as more objectively explaining the reasons for leaving the previous place than the response pattern emerging from the question discussed in the previous section.

The single largest number of in-migrants 24.8 percent of the total came to Peshawar for Government and private jobs. This does not include cases of transfer, but is inclusive of persons who came after arranging a job in the city and also those who came in the hopes of getting one.

The next largest category is of those who came for business. They numbered 59 or 20.9 percent of the total. Another 10.6 percent came as they had been transferred (in service) to Peshawar, and 10.3 percent came in the hope of better employment opportunities. This latter group had not arranged a job in advance of moving into the city.

About 7 percent/respondents came as they got job in factories.

These appear to be cases of pre-arranged employment. A little over 5 percent respondents came for learning some trade as apprentices. Expectation of higher income was stated as a reason of the for in-migration by 1.42 percent/respondents.

#### Reasons for Selection of Peshawar By In-Higrants

Why especially peshawar was selected by in Migrants? Table 23 gives their replies to this question. The most mentioned reason was that of Peshawar being the nearest city to respondent's villages. This was stated by 27.9 percent household heads. Another 19.3 percent were encouraged to move into Peshawar because their friends and/or relatives were already in the city. The presence

of fellow villagers in the city prompted 15.6 percent respondents to follow the suit. Thirteen or about 5 percent respondents mentioned a combination of the aforestated three factors.

A total of 35 or 12.5 Percent respondents came becau e they got a job, 28 or 10 percent were transfer cases, 13 or 4.7 percent came in search for jobs, and an equal number had no specific reason to state.

A fairly large proportion, 41.58 percent of the in-migrants possessed prior information about employment opportunities in Peshawar (table 24). The main sources of information were their relatives and fellow villagers (table 25).

#### THE RURAL AREAS OF PESHAWAR DISTRICT

In a previous chapter we saw that of the in-migrants to the Peshawar city, 66.46 percent hailed from rural areas, and of the latter, those of the Peshawar District accounted for 54 percent. We also found that the overwhelming majority of these had left previous abodes because of inhospitable economic conditions there. In order to secure a closer and better view of the rural infrastructure a sample of 30 villages was surveyed in the Peshawar District. The main purpose of the survey was to seek information that would help to know, why the rural folk flock in large number to urban centres. The findings are given in this chapter.

What the survey of rural area reveals, substantiates the in-migrants reports of the inhospitable economic conditions.

pendent on agriculture for income and employment. This sector has, however, already exhausted its manpower absorption capacity. The population is on the other hand increasing fast. In such a situation one would look to the non-agricultural sector for absorbing the new entrants to the labour market. But this sector had very little to offer in this respect. No mentionable advance was made in cottage and small industries. Some noticeable development had, however, taken place in trade and commerce. However, rural sector of to-day appears to be more lively than that of a decade ago. This is particularly true of the rural areas lying close to Peshawar and other urban centres in the district. But

despite the up rising in its growth during the past few years, the rural sector is unable to fully absorb the growing number of ew entrants to the labour force. This is symptomised in the large number of wholly and under-employed people in these areas, a situation which is the most important cause of rural to urban migration. There does not appear to be any hope of reversening of this outflow unless the underlying factors are controlled.

Many people, particularly those who have not lived in villages, have a great liking for the country life. But in actual fact there is nothing much romantic about it. There is almost complete absence of medical facilities & educational facilities are extremely short in supply and poor in quality. No arrangements exist for sanitation. Nor are they all provided with proper communication and transport facilities. Though the condition of these things is much better these days than a decade ago, yet the village life is full of ordeal which few are sorry to break away from. With these general observations the survey's findings are presented as follows.

According to the 1972 Census, the population of sample villages was 71,837 which exceeded their 1961 population of 43,033 by 66.93 percent. (Table 26) In 1961, as many as 12 out of the sample villages had a population of 500 or less. The corresponding number was 6 in 1972 (table 27). The population density was 0.82 per acre in 1961, which increased to 1.38 in 1972.

Most of the sample villages are located at easy distances from the Peshawar city. As will be seen from table 28, ten of these are within ten miles distance from Peshawar. Another 8 villages

are at a distance of 10 to 15 miles. The remaining lie beyond 15 miles; but none beyond 60.

#### Communication and Transport

A fairly large number of the sample villages is connected with Peshawar through metalled roads, and railways plus metalled roads. As will be seen from Table 29 eleven of these are connected with Peshawar through metalled roads only, and four have railways plus metalled roads leading to Peshawar. The remaining 15 have road connections, partly metalled and partly un-matalled.

Railway stations are located within five miles distance in nine of the selected villages. At the other extreme, these are located beyond 15 miles in case of 10 villages (Table 30). The villagers, however, normally prefer the road transport even where a railway station is close by.

Approach roads from the sample villages to the nearest railway stations are all metalled in the case of 11 villages, entirely unmetalled in three cases, and partly metalled and partly unmetalled in 16 cases (Table 31).

Regarding the type of approach roads to the main road leading to Peshawar, the position is that there are unmetalled in 16 out of 30 villages. Only 9 villages have metalled approach roads.

Buses and non-mechanical vehicles are the most widely used means of outbound transport (table 32). Sixteen of the sample villages employ this means. In six villages only the buses, and in an equal number only the non-mechanical vehicles (tonga, bullock cart) are the main means of transportation. Only two villages

have rail plus bus service as the main means of outbound transport.

Post Office and Schools

Only 7 of the 30 sample villages have post offices. Schools exist in 14 villages. In all there are 33 schools which means that in some villages there are more than one. Out of these 33 schools 24 are primary, 4 middle, and 5 high schools (table 33).

Λ total of 5347 students were enrolled in the schools in 1975. The male students numbered 4836 or 84 percent of the total. Female numbered 961 or 16 percent. (Table 34)

#### Banking and Credit.

The sample villages have three branch offices of commercial banks, and seven cooperative societies. All the three villages bank branches exist, have population exceeding 3000. These villages are infact in the process of transformation from rural to urban classification and are already as good as small towns. They are important centres of trade, and lie close to main roads leading to Peshawar.

#### Electricity

#### in number

Most of the villages, 22 /or 73.3 percent have electricity connections. In the electrified ones, most of the houses are not electrified.

#### Medical Facility

Government dispensaries exist only in two villages. Both of these two medical units are without a qualified doctor; the compounders head these. (Table 35)

Private medical practitioners exist in nine villages. There are in all 23 of them. Only 2 are MBBS both in the same village and 20 are unqualified practitioners. There is only one Hakim.

#### Major Occupations

Agriculture is the main occupation in all but four of the 30 sample villages. In the four villages under reference the non-agricultural sector absorbs most of the work force or is as important employer as the agricultural sector. This departure from the general pattern deserves a comment.

The prominent position of non-agricultural sector in the villages under reference is attributable principally to shortage of land, and also non-suitability of the available land for agriculture. One of these villages, Pirpiai, is in transition from rural to urban characteristics. Although, an important vegetable growing area its location pattern is helping it in gradual transformation into leading centre of trade and commerce.

Another village, 'Moduh Payan" lies quite close to Peshawar, just four miles. It has only 640 acres of land, and a population of 7233 (1972). Pressure on agricultural land, and its nearness to Peshawar have been instrumental in the ascedency of non-agricultural sector in this village.

'Durran', another village of this category, has a total arca of 473 acres, which is almost all hilly. Wood cutting, and labouraing in and outside the village are the main occupations of the people. Its population is so small, only 244 (1972), that wood cutting casual labouring, and other petty trades have conveniently absorbed the major portion of its work force.

#### Employment Level

Most of the people are employed. But how many of them and how fully? This aspect was not covered as the purpose of the survey was just to have ageneral introduction with the villages. It is,

however, indicated by the in-migrants employment level prior to migration that open unemployment would be fairly high in these villages as well. Much more serious than this is the problem of under-employment.

#### Cottage Industries

In 17 out of the 30 sample villages no cottage industry exists. In the other 13, there are 61 such units. The most frequently reported ones are, wheat milling, rice husking, and cotton ginning and "gur" making (table 36).

5.	Gur making (chani)		8	13.1
6.	Λ11 type	·-	51	100.00

#### Land and Crops

With the exception of two villages most of the land in other villages is irrigated. And of the irrigated land, most is irrigated by canals in 26 villages. Wells are the chief means in the other two.

Sugarcane is the major cash crop. Among cereals, wheat is the most important one.

#### Out Migration

Cases of out-migration have been reported from 18 of the 30 selected villages. During 1974, approximately 220 persons left these villages. The survey's objective was not to undertake elaborate estimation of out-migration but only to have a rough idea in this respect. Villager's reports on the subject indicate that considerable out-migration has already taken place, and it is increasing further. Lack of employment opportunities and low income in villages are stated to be the principal push factors.

A large number of workers from the sample villages go daily to nearby urban centres where they have regular jobs or business. Peshawar is the most important such urban centre. People from the surrounding areas come to the city daily in the morning and return after day's work. The number of such regular commuters is presently believed to be in low thousands. The important thing about this is that their number has been increasing. Speedier transport facilities have greatly contributed to this trend. People come daily to Peshawar from as long distance as 35 miles. But the majority travels from the areas lying close by 5 to 10 miles.

#### OUT MIGRATION FROM PESHAWAR CITY

Along with the study of in-migration to the Peshawar city. an attempt was made to determine the nature, extent, and causes of out-migration from it. The main aim was to seek an explanation for the declining growth rate of the City's population.

From the selected sample of households it was observed that in all 150 members of such holds were no more living in Peshawar and, were classified as out-migrants. Out of these, 140 had previously been living in Poshawar, while the remaining 10 were born outside Peshawar to the out-migrating parents. These 10 are also being treated as out-migrants as they would have been classified as Peshawar's population if the parents had not left the city.

Of 150 persons under study 8 had left the city before 1961. The year of departure of 7 out-migrants was not reported and is believed to be before 1961. Another 10 cases are in the 'not applicable category' as they were born to out-migrants after they had left the city. This leaves 127 cases of 1961 out-migration.

(Table 37)

#### Reasons of Out-Migration

Table 38 indicates that the economic and non-economic reasons were almost even. Generally speaking, the pull factors were more important than the push factors. The specific reasons of outmigration are discussed as follows.

Marriage was stated to be the cause of migration in 41.34

Table 37 OUT-MICRANTS BY YEAR OF FIRST LEAVING PESHAWAR

percent cases; who were all females. Another 10 percent left the city to establish a separate household elsewhere due to family disputes between wives and husbands.

4

Migration in pursuit of education was reported in 3.33 percent cases. These are treated as out-migrants as the persons concerned had been out for one year or more or were expected to remain out for that period.

Economic reasons were specified in 46 or 30.66 percent, cases. These are (i) offer of better jobs or/and business deal, being mentioned in 22 percent cases, (ii) hope of getting better job or/and business opportunities, 3.33 percent cases, and (iii)transfer, accounting for 5.33 percent ou-migrants. Another 13.34 percent had moved out in family; the latter are also believed to have migrated for economic reasons.

No out-migrant was reported to have left with the intention of permanently staying out of Peshawar. However, most of them, 89.3 percent, were likely to stay out for an indefinite period. The remaining 10.7 percent were expected to return to Peshawar after one year or more.

#### Destination of Out-Migrants

in number

Most of the out-migrants, 126 or 34 percent, had gone to various places within Pakistan. The whereabout of one out-mi-grants are not reported. The remaining 2.3 or 15 percent had gone abroad (Table 39).

The destinations of 36 percent out-migrants were within province of MWFP and the adjoining tribal areas. The punjab province received 34 percent and Sind 12.66 percent of the out-migrants from Peshawar city.

Place of Present residence of Out-migrants	livo.	Percent
N.W.F.P. and Tribal Areas	54	36.00
Punjab	51	34.00
Sind	19	12.66
Baluchistan	EA	, .
Other countries	24	16.00
Not reported	150 150	1.34

The single largest number of out-migrants 33 or 22 percent went to different places in the Peshawar district. The Rawalpindi district received 24 or 16 percent, Karachi and Lahore followed with 19 (or 12.67 percent) and 15 (or 10.00 percent) respectively. Mardan claimed 11 or 7.33 percent. In all other district their number was between one and three.

#### Characteristics of Out-Migrants

Most of the out-migrants, 84.66 percent were born in the Peshawar city. Including the other places in Poshawar District, the latter's share rises to 89.98 percent (Table 40).

Persons born in other parts of NWFP but resident in Peshawar at the time of out-migration constituted 6.67 percent of out-migrants to Peshawar

Table 40

#### Age Distribution

All age group up to 60-66 are represented. The concentration is relatively larger in the younger brackets 15-40 as will be seen from the following summary statistics based on table given below:-

Age Group	gradus de la companya del companya del companya de la companya de	Percent
Upto 14		20,00
15-19	•	11.33
20-30		36,00
31-40		26.00
41-		5.67
•		100.00

A comparative study of these data and corresponding age distribution of in-migrants would reveal heavier representation of younger ages in the out-migrating than in the in-migrating population (Table 41). In the latter, as we saw in an earlier chapter, the rural population is heavily represented. This suggest that the older people with heavy rural representation are easier to attract out or distract from their permanent abodes than the corresponding age groups of urban origin. Or put alternatively, the older age groups of urban areas would need far stronger incentives than their rural counterparts to leave for the other places.

#### Marital Status

Of the males 30 percent and of the females 86 percent were married. The corresponding figure for both sexes comes to 62 percent (table 48).

None of the males of under 20 years was reported as married.

On the other hand as many as 20 of the 70 married females were aged years

20/or less; one of these was only 13 years.

#### Literacy and Education

The literates slightly out-numbered the illiterates in the sample. They constituted 51 percent of the out-migrants. The remaining 49 percent were illiterates. (Table 43) Among the males, 69 percent, and among the females, about 37 percent were literate.

Taking both sexes together, 29.16 percent out-migrants had passed Intermediate and higher examinations. The corresponding figures for males and females considered separately are 37.52 percent and 13.79 percent respectively (Table 44).

The males were better educated than the females. On them, 25.57 percent had passed first degree and higher examinations. On the other hand the corresponding figure for females is only 3.45 percent.

#### Working Status

The proportion of the economically active and also the employed workers increased after migration. The rise in the working population came about chiefly due to entry to the labour market by those who were previously students.

Before migration, 23.03 percent of the out-migrants aged 10 and over were either working or available for work. In the case of males 55.93 percent and in that of females only 2.74 percent were in the civilian labour force (Table 45).

After migration the activity rate rose to 35.77 percent, for both sexes, for the males it was 73.33 percent and in case of females it declined to 2.60 percent.

All but two of the 35 males in the civilian labour force were employed before migration. After migration the unemployment rate fell to zero.

In case of female civilian labour force, none was unemployed before or after migration.

In respect of occupation before and after out-migration, the type of change as observed in the case of in-migrants is not seen in it. This indicates that as compared with the in-migrants, a larger proportion of the people under study was able to find jobs related to their previous experience (Table 46).

Before migration, 'sale workers' constituted the single largest group with 25.72 percent, followed closely by production group with 22.86 percent. This latter category became the leading one after migration, claiming 24.49 percent of the labour force.

Sale workers slipped to the second position with 16.33 percent.

Income

Pre-migration income datawore available in 28 cases and postmigration data in 36 cases. Before migration, 67.85 percent of the persons concerned earned three hundered rupees or less. On the other hand the corresponding figure for post-migration period is 44.45 percent (Table 47).

It is significant that before migration there was no case of income exceeding one thousand rupees a month. In the post-migration period 8 such cases are found; these accountfor 32 percent of the out-migrants concerned.

#### MAIN FINDINGS AND CONCLUSIONS

In pursuing the ultimate objective of finding out the factors influencing urbanization in Pakistan, the present study provides results of a sample survey of the city of Peshawar in the N.W.F.P. province of Pakistan. The data collected through the survey indicate that most of the in-migrants to Peshawar city have come-within the N.W.F.P. and the adjoining tribal areas. The previous abodes of 76.24 percent in-migrant household heads came within NWFP., and 8.16 percent in Tribal areas. The Punjab province contributed 8.51 percent and the Sind and Baluchistan provinces 0.72 and 1.06

percent respectively. The rest came from outside Pakistan.

The rural areas accounted for 66.46 percent of the in-

The rural areas accounted for 66.46 percent of the inmigrants. Of those originating from within NWFP and tribal areas 70.93 percent were from rural areas.

Among the different districts taken separately, Peshawar district itself is the single most important source, claiming 40.54 percent in-migrants household heads. Mardan and Kohat are the other important ones with 10.64 percent and 6.64 percent respectively. The Mahmand Agency contributed 5.67 percent.

Among the characteristics that prominently distinguish the in-migrants from the Province's population in general is their literacy rate. The survey revealed that 39.7 percent in-migrant household heads were literate. Of the total literates 76.7 percent had attained Matriculation and higher levels of education.

The corresponding estimate for all in-migrting population aged 5 years and above are 31.3 percent and 46 percent respectively.

These findings strongly suggest that with the spread of higher education among the rural folk mobility from rural to urban areas is likely to increase further. The main explanation lies in the lack or the absence of suitable jobs for the educated manpower in the rural areas. Even otherwise the educated people seem to prefer the urban life to the rural. This is suggested also by respondent's statements of reasons for leaving their previous abodes.

On the basis of the present study no objective conclusion the can be reached about/association between caste and mobility of the people. However, the study hints at the possible influences of caste on the occupations of the people and thereby on their mobility, if the occupations concerned offer better employment prospects in the cities.

There are however, strong suggestions about the fact that to the occupations which are monopolised by a given caste group in the city, the new entrants to that occupation from outside are most from the same caste groups. For instance, tea shops, firewood stalls, casual labour and patty vending are monopolised by 'Mahmand'. This facilitiates the entry of people from Mahmand' tribe to the city, as they get preferential treatment in the matter of employment. Thus, while nothing conclusive can be said about the impact of social castes on mobility, the survey's findings do suggest that certain occupational groups are more mobile than others.

Noticeable improvement took place in the in-migrant's income and employment level due to migration. Also their occupational composition underwent a significant change.

Previously 12.06 percent of the in-migrating household heads were unemployed. The unemployment rate fell to 1.03 percent after migration.

Before migration 11.24 percent respondents under reference earned less than fifty rupees a month. After it, only 0.77 percent belonged to this category.

Agriculture was the single largest employer before migration. Production, sales and service groups emerged as the principal ones after migration, accounting for 31.32 percent, 25.00 percent, and 10.23 percent of the workers respectives. The shift is quite consistent with the skill composition of the in-migrants.

The reasons for which the respondents left their previous places of residence can be sifted into (i) economic, (ii) non-economic and (iii) a combination of the aforestated two. Economic of the reasons were specified by 68.44 percent/respondents, non-economic by 7.44 percent, and the combination of these two by 24.12 percent.

The push factors appear to be more dominant than the pull factors. That is, they were forced, not attracted out of their previous abodes. Thus 33.68 percent stated that they left because income was insufficient. Another 5.32 percent left because of lack of employment opportunities in the villages after education,' 2.32 percent due to insufficiency of land, and 5.32 percent for lack of non-agricultural jobs.

The rural areas of Peshawar district were briefly surveyed as a part of an attempt to discern the factors of migration. The of findings of the survey reinforce the existence/push factors indicated by the in-migrants. The people in rural areas are heavily

dependent on agriculture. Only 6I units in cottage and small scale industry were enumerated in the 30 sample villages. Land is limited and the population is growing fast.

92246 & 3844 \$200 L

Some briskness has been observed in trade activity.

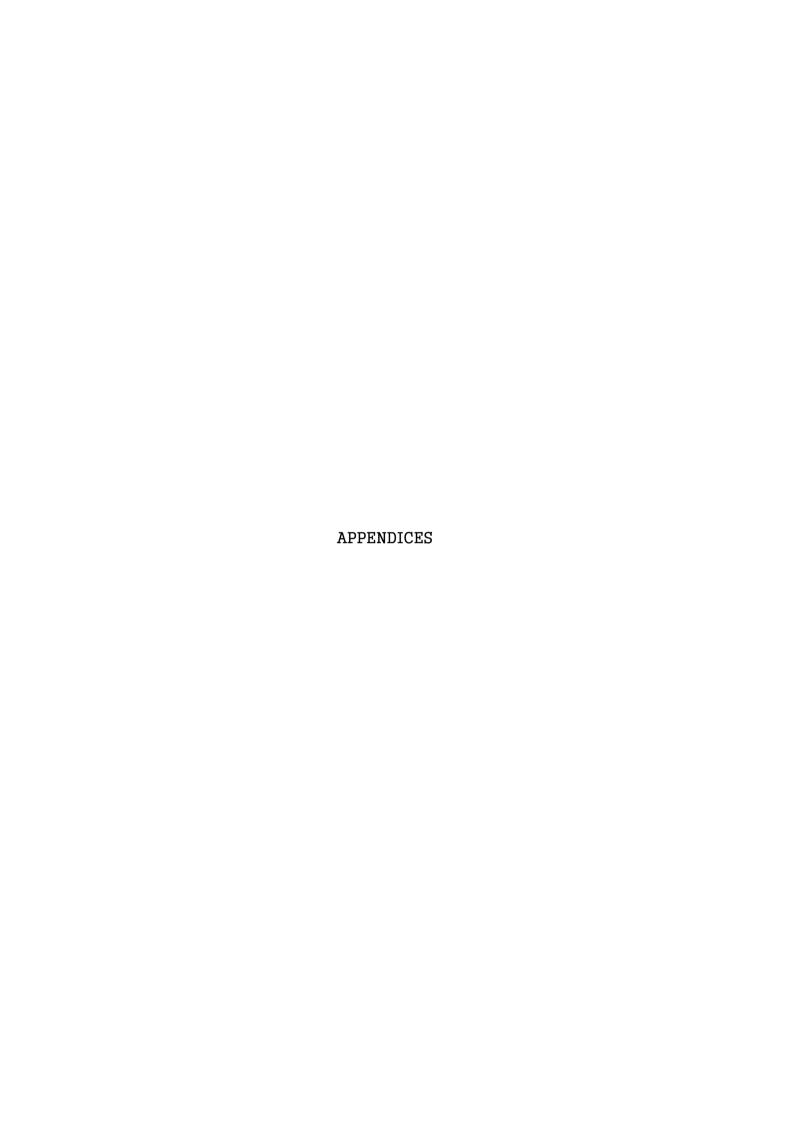

Rising prices of sugar cane, wheat, fruit, and vegetables have brought some relief to growers. Commercialisation of agricultural activity is on the increase. But despite all this, the villages are losing people in large number, as their manpower absorption capacity is limited while the supply of manpower is increasing fast. The pressure of the out-bound population is partly on the nearby urban centres; Peshawar, Nowshera, Mardan, Charsadda etc. in NAFP; but mainly on those in Punjab and Sind.

Most of the nut-migrants left for places within the country. Those going abroad accounted for 15 percent of the total migrants.

The primary reasons for out-migration included Marriage, family problems and transfer of service or search for job.

None of the out-migrant was reported to have left the city with the intention of staying out for ever. The period of stay out of Peshawar was expected to be one year or more in 10.7 percent cases. While the others were likely to stay out for an indefinite period.

Unlike the in-migrants to Peshawar, most of the out-migrants went into occupations which were related to their previous experience. They also enjoyed a better level of income and employment in their new places of work as compared with the in-migrants.

19.	Respondent's sex.	

#### Part-II

## (The following information was obtained from household members)

- 1. Ralation with household head
- 2. Sex
- Age (completed years)
- 4. Marital status
- 5. Caste
- 6. Religion
- 7. Education.
- 8. Place of birth
- 9. Occupation after moving into Peshawar
- 10. Occupation before moving into Peshawar
- 11. Monthly income after coming to Peshawar
- 12. Monthly income before coming to Peshawar
- 13. Money received from home
- 14. Money sent home
- 15. Place of previous residence -Village/City
  District
  Province
- 16. When did you come to Peshawar?
- 17. Why did you leave the previous place of residence?
- 18. Why did you come to Peshawar?
- 19. Why did you especially select Peshawar?
- 20. How long do you intened to stay in Peshawar?
- 21. Were you informed by any one about the opportunities in Peshawar? If yes, by whom.

#### Part-III

#### SCHEDULE FOR OUT-MIGRANTS

## The following information was obtained about the Out-Migrant

- 1. Sex
- 2. Age
- 3. Marital Status
- 4. Caste
- 5. Religion
- 6. Relationship with the household head/who answer part I & II.
- 7. Education
- 8. Place of birth
- 9. Occupation before and after leaving Peshawar
- 10. Monthly income before and after leaving Peshawar.
- 11. When did he first come to Peshawar
- 12. Reason for first leaving Poshawar
- 13. Reason for leaving Feshawar
- 14. Period elapsed since he left Peshawar.
- 15. Expected period of stay out of Peshawar
- 16. Present residence.
- 17. Reason for last leaving Peshawar.
